House of Commons, who passed the bill with no material alterations; but it was so considerably amended by the House of Lords, in the interests of justice to denominational schools and to parents desiring definite religious teaching for their children, that the government invited the Commons to refuse, as they did, to proceed further with it. During the session of 1907 the government made no serious attempt to legislate on the Education Question. But, in the exercise of their administrative powers, they put forth new regulations threatening very grave damage to Church of England and other denominational colleges for the training of teachers, and they promised, for the session of 1908, a bill even more unfavorable to the cause of definite religious teaching in schools than the bill of 1906. In these circumstances the friends of such teaching were preparing themselves, in the winter of 1907-8, for another strenuous struggle, and were pressing upon the consideration of their fellow countrymen, as the principle on which alone a permanent solution of the Education Question could be based, the admission of the right of parents to secure, so far as reasonably practicable, in all elementary schools the types of religious instruction which they respectively desire for their children.

TALBOT BAINES.

Secretary of the National Society for Promoting the Education of the Poor in the Principles of the Established Church throughout England and Wales.

II

(FROM THE NON-CONFORMIST POINT OF VIEW)

The Non-Conformists claim that from rates which all rate-payers are compelled to pay, no matter what their religious or lack of religious view, the government has no right to support schools in which the denominational teaching of any church or churches may be forced upon the children of the State. The Non-Conformists stand (1) for the application of the principle of the total severance of the functions of Parliament and of religious societies to all State education. They stand (2) for the entire control of national education by the people, and the exclusion of churches as churches, and priests as priests, and ministers as ministers, and parents as parents from such control, and for the admission of parents, ministers, and priests as citizens and only as citizens. They stand (3) for the complete exclusion of all theological and ecclesiastical tests for teachers and require only drilled capacity and character.

Resolutions of Dec. 20, 1905, of the General Committees of the National Council of Free Evangelical Churches declare that the aim of State education should be:

(1) To secure a truly national and efficient system of education.

(2) To secure justice to every citizen.

(3) To wound no conscience.

(4) To bring about a lasting educational peace.

The basis of the system should be exclusively civic, exclude preferential treatment for any person or persons, clergy or teachers; and for any institution theological or ecclesiastical. It should cast the entire responsibility for theological and ecclesiastical teaching on the home and the Church.

This means—

(1) That no change in the number of managers—such as substituting two for four, or electing representatives of parents, and the like—will suffice.

(2) That the non-provided schools must either be transferred to the State or be maintained by the denomination as denominational schools; for as State schools they must cease,

and no arrangements for sectarian teaching should have any place whatever in the State system.

(3) That it should be the aim of the government to secure the provision of public schools (purely civic schools) at positions convenient for the children all over the land; for it is certain that educational peace will not be secured until the education given by the State is carried on in non-ecclesiastical buildings owned by the public.

(4) That those provided school buildings only should be purchased which are found after careful and competent investigation to be suitable as to structure and condition to become public property for educational purposes and should not be rented for a longer period than five years.

(5) That the utmost care should be given to secure such schools as belong, or in part belong, to the public for the public.

(6) That State education should return to some form of the *ad hoc* system. That cooptation should cease. That women shall be eligible for election on the local education authority on the same terms as men. That the administrative breakdown of the present arrangement should be met by recognizing: (a) That the county areas are in most cases far too large. (b) That local interest in education is being destroyed. (c) That areas of suitable size should be substituted for county areas. (d) That such local authorities might have power given them to combine for specific purposes, e. g., secondary education.

Non-Conformists cannot on any account admit the principle that (a) the churches have the right to give, or (b) the parents a right to demand, any denominational teaching whatever in connection with public school life.

That the entry of sectarian teachers into State schools and training colleges during the hours allotted for State work should be absolutely forbidden as fatal to the efficiency of the teaching, disturbing to the order of the school, and productive of religious strife.

That in case public school buildings are used, by permission of local authority, for imparting dogmatic and ecclesiastical teaching to the children attending the school outside school hours, a payment should be made by the denomination so using the buildings to cover the expenses connected therewith.

That no denomination shall be allowed to use the teachers or other officers or machinery of the State for such denominational teaching.

The foregoing provisions also have reference to secondary education as far as they may be applicable.

Not for a very lengthened period has the Free Church mind been so deeply moved as upon this question.

The root of all the evil is to be found in the existence of a Church establishment. There is general agreement among Free Churchmen as to the origin of the two pernicious educational measures which they have so justly denounced. For some years past a section of the supporters of the Established Church have been persistently undermining the Act of 1870. When the time appeared to be ripe for the purpose, the two Anglican convocations formulated their demands and urged them upon the government. These were, with one exception, acceded to, and formed the basis of the Education Bill of 1902. Still further concessions were made to the Church of England during the passage of the bill, and notably as the result of the action of the bishops in the Lords.

Solicitude for religious education has been expressed in justification of this course; but few will doubt that the struggle has been mainly one for the retention and the strengthening of the Church establishment. Had that institution not existed, and had its bishops no seats in Parliament, such bills would never have been introduced.

The force we are fighting, then, is not primarily political. Parliament is only its tool. It is ecclesiastical. "Clericalism is the enemy." The reversal of the broader and more just educational policy initiated in 1870, and the return to the clericalism of the beginning of the last century, is due to the change which has taken place in the Anglican Church, in its ideas and spirit, its temper and aims. It is not the tolerant and inclusive Church of the days of Lord Shaftesbury, but the

bigoted and persecuting Church of the times of Laud and Whitgift. It is a Romanized church; and in and by the English Church Union it is becoming increasingly Romanist. It is that section—the large and dominating section of twentieth-century Anglicanism—that has given us these acts. It is the victory of the High Church party.

It has been said there is taught now in the council schools of London and in the "unsectarian" or "provided" schools of the country, "a new-fangled faith," an "unsectarian religion," which "is only another expression of non-conformity," "a novel form of religion, whose only recommendation is that it pleases Dr. Clifford and his friends," and we are told that what Romanists and Anglicans have secured by their prolonged efforts in the Education Acts of 1902 and 1903 is the opportunity of giving "our poorer brothers a way of escape from the threatened universal domination of modern unsectarianism" or of the Free Churches.

According to the "London syllabus," children are taught at the expense of the State Psalm xxiii., the Ten Commandments, the Lord's Prayer, the Beatitudes, the blessedness of hunger for what is right and just, of making peace between individuals and nations, of purity of thought and spirit—in short, the religion which consists in "doing justly and loving mercy, and walking humbly with God." They are introduced, not to the whole of the Bible, but only to those portions of the Testament best suited to their capacity, and least likely to suggest controversy; to the purest ethic, the most quickening poetry, the most inspiring biography, i. e., to the most potent character-building literature the world contains; and I confess that to me it appears that if Parliament undertakes the education of the children of the nation it ought not to fail to open the doors for them into this all-hallowing temple of truth and justice, liberty and progress.

I know this is not "teaching religion" in the sense of the High Church party; but in my judgment it is all the State is competent to do, and all it can attempt without inflicting injustice upon some portion of its members.

Against being compelled to support schools where principles are taught they cannot in conscience accept, very many Non-Conformists have felt it their duty to refuse to pay their full education rates and inaugurate a policy of "passive resistance to the payment of the sectarian patron."

Over 400 imprisonments have taken place and more than 100,000 distrainments of goods have been carried out. The reasons given in court for resistance were:

(1) That the Education Acts of 1902 and 1903 compelled him to pay for teaching on the deepest subjects of the inward and religious life; subjects with which the State, or Parliament, or Borough Council has no right whatever to deal. They are personal, individual, and the State ought to leave them to every man's conscience. Complete freedom in this thing is the right of every British citizen, a right he would enjoy if he dwelt under the British flag in Canada or Australia, and a right he cannot surrender because he lives in England.

(2) That the law attempts to coerce him to pay for teaching children doctrines and practises he holds to be distinctly opposed:

1. To the teaching of Christ;
2. To the well-being of the child; and

3. To the happiness and prosperity of the nation.

(3) That by this law he is compelled to pay, that the children of England may be taught that the doctrines he has held and taught for nearly fifty years are false, and that the Free Churches, to which he is grateful to belong, are heretical and to be avoided as the plague.

Non-Conformists cannot and will not accept any such legislation. Let others teach them if they so believe, but let them not compel me to do so.

JOHN CLIFFORD.

SCHOOL SAVINGS-BANKS are simple devices to teach children to save. Any school can start one. There is no association needed. The only thing necessary is the permission of the School Board and the cooperation of some bank to receive weekly deposits. In most school banks the roll-call of the children is made every Monday morning and the amount of each deposit and credit is checked off on a card. It teaches the children thrift, the value of pennies, and saves much careless and often worse than useless expenditure. In Europe they have long been used and are acknowledged and proved to be one of the best practical educational factors.

In France they are under patronage of the government. In many countries they are connected with the postal savings banks and the statistics of postal saving-banks (*q. v.*) and school savings-banks are officially reported together, in several divisions of Europe.

In 1885 Professor Thiry, a French educator, in America for his health, as a school commissioner in Long Island City, introduced the system into the public schools there. Since this date the system has spread widely, and by 1893 325 schools had such savings-banks.

From a statement compiled by Mr. Thiry in 1905, it appears that there were then 4,541 school-banks in operation located in 1,089 schools in 109 cities in the United States. The number of scholars registered in these schools is 347,895, of which 191,009 are depositors in the school banks. The amount collected since the introduction of the system is shown to be \$2,782,012, the amount withdrawn \$2,165,072, leaving a balance due depositors of \$616,940.

Another similar system is the Penny Provident Bank. This was established in New York City in 1889 and has to-day some 60,000 depositors in all portions of the country. Cards are given to depositors, with the rules of the Fund on one side, and thirty-six blank squares on the other. Stamps are then sold to the depositor, to be attached to the squares. The stamps may be of eight different values from one cent to one dollar. When the card is all filled the amount represented is paid to the depositor and he is urged that not required to open an account in some savings-bank. A second card is then given. No interest is paid on these deposits, the object being to encourage the saving of small sums which can be deposited in a bank where interest is paid. In this way depositors in the Fund saved \$480,272.61 in ten years. The system has been used in schools with great success. Central office, Fourth Avenue and Twenty-second Street, New York.

SCHOOLING OF ADULTS, THE (through free evening lectures in schoolhouses), has been developed chiefly in New York City through the Department of Public Lectures of the Board of

Education. It is based on the assumptions that education is never finished, and that large numbers of people who had to leave school early, owing to the stress of making a living, are anxious to get whatever knowledge they can. The purpose of these lectures is accordingly twofold: informative and constructive. Some lectures and lecture courses, e. g., on travel and geography, furnish interesting information, while others, e. g., on physics and electricity, are arranged in a systematic manner and cover those subjects fully.

The lectures started on the former basis and tentatively in 1889, but gradually introduced more serious and better-connected subjects. While 189 lectures were given during the first season to about 20,000 listeners, 4,645 were given in 1904-5 to an attendance of 1,155,000. In all new schoolhouses lecture rooms are provided adapted for adults.

The need of this movement is readily seen from the facts that only about 3 per cent of the school population attend the high schools, and 1.5 the colleges, universities, and professional schools; that New York has a very large percentage of adult foreign-born citizens who need instruction in civics, the uses of liberty, English, etc.; that, finally, lectures in English literature were attended by classes of 300 (chiefly teachers), others on the "Social Significance of European Capitals" by 1,000 in one center and 1,700 in another, others on "Great Masters in Music" by 1,000. (See article EVENING SCHOOLS.)

Dr. Henry M. Leipziger, the Supervisor of Lectures, sums up the results of the free lectures in an article of "Social Service" (July, 1905) thus: (1) Adult education is established as a permanent feature of our educational scheme. (2) Reading and study have been encouraged, a deeper interest in school life developed, and a refining influence spread. (3) Cooperation has been brought about between the lecture, the library, and the museum. (4) The best teachers in our universities have come in contact with the people. (5) The school is becoming the social center of the community. (6) The schoolhouse must be constructed with a view to its use for various educative influences, so as to become not merely a nursery for children, but a place of intelligent resort for adults.

SCHOOLS OF PHILANTHROPY: The need for systematic instruction and training as a preparation for social work in the distribution of public and private charity, in philanthropy, and in many branches of educational activity was felt long before anything so formal as a school for this purpose was contemplated. Many societies like the Charity Organization Societies have long had their training classes, which meet weekly and sometimes oftener, for conference and reading and study under the direction of their chief executive officers, to increase the efficiency of their staff and volunteers. Many colleges and higher educational institutions have recognized this need by establishing special courses for practical workers.

1. *The New York School of Philanthropy* began in 1898, under the title *The Summer School in Philanthropic Work*, the first systematic effort at highly specialized instruction in this field alone. It is a significant fact that the Charity Organization Society of the City of New York organized this school, which held in the rooms and library of the society a six weeks' session crowded with lectures, class discussions, preparation of papers on special topics, and visits to institutions. It began the latter part of June at the close of the usual collegiate year and drew largely from

among the brightest students and graduates of the colleges. Dr. Philip W. Ayres was the first director under whose skillful management, and later under that of Dr. Carl Kelsey, the summer school developed. Mrs. Anna Garlin Spencer and Dr. Edw. T. Devine, the first director of the enlarged school, were the pioneers in the work of the winter course. The present writer succeeded Dr. Devine as director, and Prof. R. C. McCrea has been appointed associate director. This summer meeting has been continued as the summer session of the larger school now organized and endowed, still under the direction of the Board of Trustees appointed by the Charity Organization Society, in accordance with the terms of the endowment given by Mr. John S. Kennedy. The first winter session was held in 1903-4 and conducted along the lines of the summer course, but extended through six months with one or two lectures a week and class exercises and visits to institutions in addition. The course was divided into six parts: (1) Introductory, general survey of charitable field; (2) aid for the sick and preventive work in behalf of public health; (3) the care of dependent, neglected, defective, and delinquent children; (4) the care and treatment of needy families in their homes; (5) the care and treatment of needy families in institutions; (6) moral reform, educational advance, social uplift. The lectures were given by a large number of expert workers.

The next three years witnessed a rapid development in the number of lectures and in the serious demands the work made on the time of the students, about half of whom were college graduates, or have had college training, and two-thirds of whom were women. The majority of the men and women students expect to follow social work as a profession, although a goodly number are preparing to give their time in part or whole as volunteer workers, as district and church visitors, managers of societies, and social investigators. The lectures given in the academic year from October to June now number twelve per week or over 350 in the year, and there are twelve hours additional per week given to field work in visiting, inspection, and investigation under trained supervision.

The course is divided into eight groups:

- (1) Survey of the field. Principles, theories, and methods of general application.
- (2) Racial traits in the population. A study in sociology.
- (3) Constructive social work.
- (4) The care of families in their homes.
- (5) Administration of charitable and educational institutions.
- (6) Child-helping agencies.
- (7) Treatment of the criminal. Reformatory methods. Probation.
- (8) The state in its relation to charity.

The first four groups are required of all students, and at least two of the other four. The tuition fee is \$50 for the course, and \$10 for the summer session. A limited number of free tuition scholarships are granted and a few scholarships yielding a stipend of \$100 in addition to free tuition are awarded as loans where conditions justify it. A Social Research Bureau for advanced work has been organized and some fellowships yielding a stipend sufficient to meet living expenses are offered to experienced investigators who are able to undertake tasks which promise to enrich our literature and knowledge of social conditions. The New York School is affiliated with Columbia University; the students of both institutions have reciprocal advantages in attending lectures given in either, with academic credit for the higher degrees for work done satisfactorily in either place. The school has an excellent special library with 5,000 bound volumes and more than that number of unbound pamphlets, reports of societies, etc.

2. *The Boston School for Social Workers*, organized in 1904-5, is maintained by Simmons College and Harvard University and managed by a joint committee. Men register at the university, women at Simmons College, paying in either case a minimum fee of \$100, which covers all charges for the work of the school which follows somewhat similar lines to that in New York. Less emphasis is laid on the lecture method of instruction and more on closer supervision of field, practice, and case work, assigned readings, and class quizzes and discussions. This school from the beginning has been under the direction of Dr. Jeffrey R. Brackett and Miss Zilpha D. Smith, assistant. Ten hours a week are devoted to class instruction. No summer session is held. The course covers one academic year for the satisfactory completion of which, as also in New York, an appropriate certificate or diploma is given. Research work has been organized as a department of the work of the school for trained investigators.

3. *The Chicago Institute of Social Science* was started in 1904 as the "Social Science Center" and later as the "Institute of Social Science and Arts" under the auspices of the University College of the University of Chicago. In Jan., 1906, it was organized as an independent school. Lectures are given in the afternoon after 4.30 o'clock and in the evening, which enables many students to attend who are engaged in other work while taking the courses, while in Boston and New York most of the students must devote their whole time to the work of the school. No field work is required except visits to institutions, but is arranged for

when desired. The courses given are: (1) Principles and Practice of Social Philanthropy, twelve lectures; Introduction to the History and Literature of Philanthropy, four lectures; The Field and Requirements for Social Work, four lectures; (2) Child-Helping Agencies and Institutions, eight lectures; (3) Boys' and Girls' Clubs; Basis, Methods, and Leadership; (4) Causes and Treatment of Dependency, twelve lectures; (5) The Social Aspects of Industrial Organization, twelve lectures; (6) Juvenile Delinquency, twenty-four conferences; (7) Educational and Welfare Work in Factories and Stores, twelve conferences; (8) Industrial and Civic Administration, twelve lectures.

A summer session of six weeks was held in 1906 and is announced for 1908. Tuition charges are \$25 for all courses offered during the year and \$10 for the summer term.

Research work is organized as in New York and Boston and Miss Julia Lathrop has been added to the staff for its special supervision. Prof. Graham Taylor has had charge of the school from its beginning.

4. *The St. Louis School of Philanthropy* has grown out of courses of lectures by prominent charitable workers, a series of conferences of said workers and visits to institutions which were carried on for four years prior to the organization of regular class work, and the arrangement for the direction of such work made with the University of Missouri in May, 1906. In 1907, two courses of fifteen lectures each were given on Friday afternoons, from two to five o'clock, from Feb. 1st to May 17th; one on Preventive Philanthropy and the other on Remedial Philanthropy. Class discussions and required readings were provided for, and in addition four public evening lectures by specialists and four conferences were held. The announcements for 1908 include three courses similar to the two given in 1907 and six short courses of three lectures each by specialists in different fields, and for 1908-9 a course covering eight months. All the work is of University grade, under the direction of Prof. Thos. J. Riley, and may be credited toward degrees at the University of Missouri. Tuition fees are based on membership in the association, which sustains the school and a moderate charge for courses taken (\$5 for each course of fifteen lectures in 1907).

5. *Courses in Social Work at the University of Pennsylvania.* Work, organized along the same lines as the St. Louis School and with some of the variety of the summer session of the New York School, is done in Philadelphia through the courses in Social Work at the University of Pennsylvania, which was one of the first of the larger colleges to adopt the term "Social Work," and to organize in 1899 its courses so as to give a definite course in social work. While this work is not definitely organized as a separate or independent school it is under the direction of a special committee appointed by the university authorities and independent of university restrictions as to admission, etc. Two afternoon lectures each week throughout the college year, many of them given by practical specialists, class exercises, and visits to institutions are provided. Tuition fee is \$15 for the entire course.

The planning and supervision of this work was begun by the present writer, and has been continued by Prof. Carl Kelsey.

Many similar schools exist abroad, notably in England, but all are of recent date. The London Charity Organization Society's Committee on Social Education discuss the needs of London in securing better observation and more expert knowledge in dealing in a practical way with problems of the city, and the result was the establishment in Oct., 1904, of the School of Sociology and Social Economics. The University of Liverpool established, Jan., 1905, a School of Social Science and Training for social work with both summer and winter sessions and excellently well-planned courses of instruction, practical work, research, and classes extending in some cases beyond one year's work.

SCHULZE-DELITZSCH, HERMANN: Founder of Cooperative Agricultural Banks; born 1808 at Delitzsch, Saxony. Educated at Leipzig and at Halle, he was made judge at Naumbourg and then Berlin, and in 1841 entered the royal magistracy. Spending his vacations in travel, he became deeply interested in the working classes. After the revolution of 1848 he was elected deputy by

the electors of Delitzsch, and took his seat on the left center with Rodbertus. But seeing the victory of a reactionary opposition, he retired to Delitzsch and there commenced the movement to establish the cooperative agricultural banks with which his name is connected. (See CO-OPERATIVE BANKS.) Became leader of the individualist policy of cooperation without State aid, and so when Lassalle commenced his Socialist propaganda, Schulze-Delitzsch was invited by the working men of Leipzig to champion his ideas against Lassalle, but declined, and the majority of the working men turned to Lassalle. (See GERMANY AND SOCIAL REFORM.) His cooperative movement, however, went on, and on his death, in 1885, had reached large proportions.

SCHURZ, CARL: Publicist and political reformer; born 1829 near Cologne; was educated at Cologne and University of Bonn. He took an active part in the Revolution of 1848-49, and was compelled to leave Germany. After sojourning in Switzerland, Paris, and London, he came to the United States in 1852 and settled in Watertown, Wis. In 1860 he was a member of the Republican Convention; became U. S. minister to Spain in 1861; resigned to enter the Union Army where he was successively promoted until he became brigadier-general, and served in many engagements. He was editor of and contributor to a number of papers, e. g., *New York Tribune*, *Evening Post*, *Westliche Post*, etc. U. S. Senator for Missouri, 1869-75; presided over convention which nominated Greeley; was appointed Minister of the Interior by President Hayes, 1876. Later supported Cleveland, and became one of the founders of the Independent Party. Died in New York City, May 14, 1906. He published "Speeches"; "Life of Henry Clay"; "Abraham Lincoln, an Essay"; "Memoirs" (1906).

SCOTLAND: Scotland, tho comparatively a small country, has had an important influence on the modern world owing to the intellectual and commercial energy of its people, and to the remarkable colonizing habits of its emigrant population in new lands, notably in Canada, Australia, and New Zealand. The fame of Burns, Sir Walter Scott, and many other Scottish writers is world-wide, and science and industry owe a great deal to eminent Scotsmen such as Adam Smith, the founder of the modern science of political economy; Patterson, founder of the Bank of England; James Watt (steam-engine), Murdock (gas illumination), Nasmyth (steam-hammer), Hutton and Sir Charles Lyell (geology), Sir Charles Bell (anatomy), Napier of Merchiston (inventor of logarithms), and Dr. Simpson and Lord Lister (anesthetic and antiseptic treatment in surgery). Many notable Englishmen have been wholly or partly of direct Scottish extraction, as, for example, Byron, Macaulay, J. S. Mill, Ruskin, and Gladstone. Scotland is to a great extent a mountainous country and possesses many fine estuaries, rivers, and inland lakes.

RACE AND EARLY HISTORY

The people of Scotland are of a mixed race. In the north and west (the Highlands) they belong chiefly to the Gaelic-speaking branch of the Celtic race, while in the east and south they are largely of Saxon and Scandinavian origin or admixture. Among the Highlanders the Gaelic or

Erse language (which is held to be allied to the early Latin dialects) was universally spoken until recent years. Among the

Race

Lowlanders the Scotch vernacular (really a dialect of the older English speech) was the tongue of all classes down to about fifty years ago. Both the Gaelic and the Scotch are now giving place to the modern English language. The Highlanders remained under the primitive clan system, ruled by chiefs, until the political repression of the clans following upon their rebellion in 1745 in support of the restoration of the Stuart dynasty to the British throne.

Scottish history usually begins with the resistance of the then native inhabitants, the Scots and Picts, to the Roman invasion. The Scots were Gaels (Gaidheal, Celts) who had crossed from Ireland and settled in the western parts of the country, and the Picts are supposed by some to have been an earlier branch of the Celtic people and by others to have been of Iberian or perhaps non-Aryan stock. Unable to subdue the Scottish tribes the Romans fenced them out of their southern dominions in England by building a great wall extending across the base of Scotland from the Solway to the Tyne, and later another wall farther north from the Clyde to the Forth. On the withdrawal of the Romans from Britain, the Saxon kings of England succeeded in obtaining a lordship

History

over the southern part of Scotland, and for several hundred years the Scots endeavored by frequent battles to cast off the English yoke. The independence of Scotland as a kingdom was finally secured by the valorous championship of Sir William Wallace, followed by the memorable victory of King Robert Bruce at Bannockburn (1314). Thereafter until the union of the English and Scottish crowns as a result of the succession on the death of Queen Elizabeth of James VI. of Scotland, as nearest heir, to the English throne, Scotland was kept in a constant state of unrest by internal struggles between the nobles and the various kings and regents of the Stuart dynasty. During the reign of Mary, Queen of Scots, the mother of James VI., Scotland was brought into very close relationship with France, and it was then also that the Roman Catholic Church in Scotland was dissolved and the Presbyterian Church founded in its stead. The Parliaments of England and Scotland were not united until a later period under Queen Anne, in 1707.

The modern history and intellectual prominence of Scotland dates from the Protestant Reformation and the institution of the Scottish Presbyterian Church, just mentioned, under the leadership of John Knox and the famous Latin scholar George Buchanan. The Reformed Church adopted at the outset a completely democratic form of government, and in its earliest manifesto, "The First Book of Discipline," the Church laid down an exceedingly enlightened policy with respect to education, the rights of labor, and the treatment of the poor. Schools were established in every parish, and it was enjoined upon parents of every station that their children must have "a virtuous education and godly upbringing," and that all those showing an aptitude for learning should be sent to the university. It is no doubt largely to this national system of education, imperfect as it was, founded 350 years ago, together with the fierce controversies upon

religion and politics which the subsequent efforts of Kings Charles I. and II. to force episcopacy upon the nation aroused, that we must ascribe the remarkable mental energy evolved among the Scottish people. Reading and study became common in the houses of the peasants, and shepherd lads, plowboys, and the sons of the artisan class struggled into the universities and became doctors, lawyers, and ministers. The Scottish universities, which were, and still are, four in number—Glasgow, Edinburgh, St. Andrews, and Aberdeen—have always been accessible to poor students owing to the small fees charged, and to their non-resident system which allows students to board outside as frugally as they choose. It is not likely, therefore, that Mr. Carnegie's recent benefaction of \$10,000,000 to the universities will have any marked results.

Scotland, tho a democratic nation, and the home of many social pioneers, has not been, until recent years, forward in social reform. Political

Social Progress

liberty and individual freedom have been more highly esteemed than social legislation and cooperative enterprise. Altho Robert Owen established his celebrated cooperative community at New Lanark, in the south of Scotland, as far back as 1800, the public mind did not turn to collective or cooperative experiments until within the last thirty or forty years. Nevertheless, industrial cooperative societies are now widely spread and in a flourishing state in all parts of the country except in the west Highlands, and the wholesale cooperative manufacturing works at Shieldhall, near Glasgow; the baking establishments in Glasgow and Leith, and the tweed cloth mills at Galashiels and Melrose have become enormously successful enterprises. The land question has, however, always attracted deep interest in Scotland, and the crofter revolt in the Highlands (1880-85), influenced largely by the neighboring Irish Land League agitation, led to the passing of the Crofters Act (1886) by which the poorer Highland tenants have now obtained fixity of tenure, rents fixt by a public commission, and compensation for improvements. A bill extending the principles of the Crofter Act to farms paying rentals as high as £40 all over Scotland is now (1907) before Parliament. Henry George visited Scotland in 1881 and on several occasions afterward, and his teaching was enthusiastically received with the result that a Land Restoration League (now a Single-Tax League) was founded which did much to bring the question of the taxation of land values to the front in British politics.

Housing in Scotland is in a backward state. The tenement system of dwellings—large blocks four "stories," or flats, in height, each flat divided into two or three separate dwellings of two rooms—prevails in the working-class districts of Glasgow and the large towns, while in the smaller towns and villages rows of one-story cottages each consisting of only two apartments ("butt and ben") are common. The census returns of 1901 showed that there were no less than 416,311 families (1,174,000 persons) living in one- or two-room dwellings. The municipalities are making some efforts to remedy this defect.

Until recent years Scotland was the most Sabbatarian country in Europe, but now Sunday observance and churchgoing have waned, and in the larger industrial towns concerts, political meetings, excursions, and secular amusements

have quite displaced the somber religious formalism of former days. So, too, it may be said, religion generally has fallen into a state of decay; the young people are becoming indifferent to religious topics and secularism is rife. The Scottish Presbyterian Church is established by law, but more than half of the Presbyterian communicants adhere to the United Free Church recently formed by the union of two great bodies of secessionists from the parent church. In Glasgow and the mining districts there are a considerable number of Roman Catholics, chiefly Irish immigrants.

The first avowedly Socialist organization in Scotland was the Land and Labor League, founded in Edinburgh in 1883. This was followed soon

Socialism

afterward by branches of the Social Democratic Federation and the Socialist League in Glasgow, Edinburgh, and a few other towns. J. Bruce Glasier, William Nairne, and Professor James Mavor (now of Toronto), in Glasgow; and Robert Banner and the Rev. Dr. John Glasse, in Edinburgh, were the pioneers of the new Socialist movement. William Morris, the famous poet and craftsman, frequently visited Scotland in connection with the Socialist League, and greatly influenced the idealism of the young Socialists of the day. Edward Carpenter, H. M. Hyndman, and Prince Kropotkin also made occasional lecturing visits. Later, in 1888, the Scottish Labor Party, which was the forerunner of the now powerful Independent Labor Party (the I. L. P.) of Great Britain, was founded by J. Keir Hardie (then president of the Scottish Miners), R. B. Cunningham Graham, and others. Chiefly owing to Keir Hardie's successful agitation socialism in Scotland, as in England, took a definite "Labor" character and at present the Independent Labor Party is the chief Socialist organization in both countries, altho the Social Democratic Federation has also many branches, and there are one or two small groups of the Socialist Labor Party which adopts the line of the American party of that name.

At the last general election (1906) about a dozen Trade-union and Socialist candidates stood for election, but only two were successful—Mr. George N. Barnes, M.P., the general secretary of the Engineers' Society, who was returned as a Socialist and Trade-union representative for a division in Glasgow, and Alex. Wilkie, M.P., of the Shipwright's Society, who was returned as a Trade-unionist for Dundee. Both are members of the Labor Party group in the House of Commons. There are many Socialists now upon the municipal councils in the larger towns. Socialist propaganda is very active in Scotland and it is noteworthy that Robert Smillie and other miners leaders, as well as the more active trade-unionists generally, are Socialists.

Notwithstanding the union of the Scottish and English crowns and parliaments, Scotland still preserves many distinctive national habits.

Scottish law, for example, is different in many important respects from English law, notably as respects marriage (which can still be effected by a simple declaration between unmarried couples, tho unless it is registered or proven in a law court it is not legally established) and criminal trials (in Scotland the jury may bring in a verdict by a majority and the verdict may be one of "guilty," "not proven," or "not guilty," whereas in England the jury verdict must be

unanimous, and be either "guilty" or "not guilty").

Scotland retains a separate judicial bench, but the British House of Lords is the final court of appeal. Many acts of Parliament of the British House of Commons are made applicable to England but not to Scotland, and vice versa. Thus, in Scotland the public houses are since the act of 1851 compelled to keep closed on Sundays, whereas in England they are open for several hours in the afternoon and evening. Scotland sends seventy-two members to the British House of Commons and sixteen representative peers elected by the Scottish peerage to the House of Lords. In addition to the elected peers some fifty other Scottish peers sit in the House of Lords by virtue of being peers of the United Kingdom. Local government is carried on by much the same machinery as in England, namely, by town councils, county councils (1889), and district and parish councils (1893). The franchise in Scotland is, as in England, household suffrage. Women householders are entitled to vote at all elections except for Parliament.

The population is now nearly five millions (census 1901 it was 4,472,103, and in 1906 it was estimated at 4,726,070). The total acreage of the

Statistics

country is 19,543,843, of which only some 2,000,000 are under corn and green crops and 3,000,000, exclusive of mountains and moors, under rotation pasture or permanent pasture. In the Highlands the crofters cultivate their small holdings in somewhat primitive fashion and many of them engage in herring fishing during the summer season. There is also extensive sheep farming, but great tracts of moors and valleys have been turned into deer preserves. Aberdeen and Peterhead on the east coast have important granite quarries, in Dundee there are jute and flax mills, and in Paisley the great cotton-thread mills of Messrs. Coats and Clark. In the south of Scotland tweed (woolen) cloth manufacture is the chief industry. Altogether there were in Scotland in 1905 some 750 factories with over two and a half million spindles, 75,000 power looms, and 170,000 work people.

Of chief importance, however, are the coal and iron fields in the lower central basin of Scotland, the engineering and iron-molding works in the neighborhood of Glasgow and Falkirk, and the great shipbuilding yards on the Clyde which in 1905 produced (exclusive of war-ships) 254 ships of a gross tonnage of 515,588 tons, or one third of the total shipbuilding of Great Britain and one fifth of the shipbuilding of the world. There are also numerous whisky distilleries.

Broadly speaking, it may be said that recent industrial developments have adversely affected the character of the Scottish people. Drunkenness is sadly prevalent among the working class, especially in the mining districts and in the large towns. The conditions of factory and town life have diminished the stature and lessened the stamina of the people. Their finer intellectual qualities have been impaired. Football, betting, and a habit of general indifference toward serious matters have displaced the more earnest poetical and thoughtful inclinations of the people. Scotsmen are usually of a somewhat "canny" and shrewd disposition, but are easily roused to intense vivacity and combativeness under excitement. They are fond of argument and a strong sense of critical humor is displayed in their con-

versation. Their great persistency of purpose and working capacity is shown by the many Scotsmen who have achieved high political and economic positions in all parts of the world. Until late years Scotland was preeminently a land of song. No country for its size has produced a greater wealth of dance music and lyrical poetry—the former represented by the Highland strathspeys and reels and the latter by the songs of Robert Burns.

J. BRUCE GLASIER,

Editor *Labour Leader*, Hotspur Press, Manchester, England.

SCOTT, ROSE (MISS): President of Woman's Political Educational League (non-party and non-sectarian) and treasurer of National Council of Women, New South Wales; born Glendon, Hunter River, Oct. 8, 1847. Honorary secretary of Womanhood Suffrage League of New South Wales, from its foundation in 1891. She has traveled and lectured extensively as a champion of woman's political rights. Was vice-president of Early Closing Association and vice-president of Woman's Club, and member of Ladies' Committee for Assistance of Discharged Prisoners. Address: Lynton, 294 Jersey Rd., Sydney.

SCOTTISH TEMPERANCE LEGISLATION BOARD, THE (the with which is incorporated *The Scottish Alliance for Temperance and Social Reform*), is a large and influential society of earnest practical reformers whose purpose is to secure for the community a more effective control of the liquor traffic, and give powers to each locality to carry practical temperance reforms, by submitting a wide variety of options to the decision of the electorate, under statutory conditions that are consistent with the public welfare. It was formed to endeavor to obtain further temperance legislation on the lines of Lord Peel's minority report of the Royal Commission on Licensing appointed in 1898. Lord Peel, who was chairman of this royal commission, along with several of the other members did not concur in the report signed by the majority of the commission and issued a separate report suggesting (1) a large reduction in the number of licensed houses in Great Britain, (2) compensation to the license holders dispossessed by a time notice of seven years for England and Wales and five years for Scotland, and (3) thereafter wide powers of local control, under which the electors might vote either for veto or disinterested management of the traffic if such were continued. Office: 208 West George Street, Glasgow, R. X. Bremner, solicitor, secretary, and also at 10 Albyn Place, Edinburgh, G. F. Barbour, secretary.

SCUDDER, VIDA DUTTON: Author and professor at Wellesley College; born 1861 in southern India; graduated from Smith College, 1884; and pursued graduate studies in Oxford and Paris. She took a leading part in the formation of the first college settlements (see SETTLEMENTS) and has been active in their work since. Her chief interest of this type since 1904 has been social and educational work for immigrant Italians. She has written on various subjects; the writings which have a social bearing are: "Introduction to the Writings of John Ruskin" (1890); "The Life of the Spirit in the Modern English Poets" (1895); "Social Ideals in English Letters"

(1898); "Selected Letters of St. Catherine of Siena" (translated and edited) (1905); "The Disciple of a Saint: A Spiritual Romance" (1907). Address: 250 Newbury Street, Boston, Mass.

SEDDON, JAMES ANDREW: Member British Parliament of Independent Labor Party for Newton, Lancashire, S. W.; born 1868 at Prescot, near Liverpool; educated at elementary schools at Prescot and Hayton; was a grocer's apprentice, but tired of the monotonous life behind the counter after sixteen years, and became a commercial traveler. He came in close touch with the men of his trade, both at St. Helen's and in the neighborhood; joined the Shop Assistants' Union, became a member of the Executive Committee of the branch at St. Helen's in 1898, and president in 1902. He joined the Independent Labor Party, and was elected to Parliament in 1906. Is much in demand as a speaker; and an uncompromising Socialist. Address: 48 Lingholme Road, St. Helen's, England.

SEDDON, HON. RICHARD JOHN: Premier of New Zealand, 1896–1906; born in Lancashire, England, 1845. Becoming a mechanical engineer, he went to Australia in 1863 and to New Zealand in 1867, when the gold fever was at its height. Later, becoming head of a successful mercantile enterprise, he entered public life and was elected to Parliament, 1879. When the Liberal Party came into power Ballance (*q. v.*) made him minister of public works, and on the death of Ballance he became premier, 1896, till his own death, 1906. Called "Digger Dick" in his old mining days, and later "King Dick," he was always a champion of the oppressed, tho he loved to call himself "Premier of the Paradise of the British Empire." Uncorruptible and loved, a born leader, he was a good worker, at one time being premier, colonial treasurer, minister of labor, minister of defense, and minister in charge of the public trust and of the government insurance offices.

SEILHAC, LÉON, COMTE DE: Permanent deputy to the Musée Social at Paris, and chief of the Service Industriel et Ouvriers; born Aug. 8, 1861, at Seilhac, in the department of Corrèze. He is a publicist, editor-in-chief of *La France Nouvelle*; editor of the *République Française*—founded by Gambetta—of the *Revue Politique et Parlementaire*, of the *Correspondant*, and of the *Revue Bleue*. Politically he is a Republican, and in economics hostile to the orthodox school and an advocate of the largest possible social reforms. He is opposed, however, to any kind of collectivism, because he believes that private property is the mainspring of human activity, the highest reward of labor, and the greatest source of joy for mankind. Author: "Le Monde Socialiste"; "Syndicats, Federations, et Bourses du Travail"; "Les Longrès Ouvriers"; "Les Grèves." Address: 48 Faubourg Poissonnière, Paris, France.

SELIGMAN, EDWIN ROBERT ANDERSON: Professor of political economy; born 1861 in New York City. Educated at Columbia Grammar School and Columbia University. Studied for three years at Universities of Berlin, Heidelberg, Geneva, and Paris. Prize lecturer at Columbia, 1885; adjunct professor there 1888–91. In 1891 appointed to his present professorship; 1902 president of American Economic Association;

president Tenement-House Building Company; president of Bureau of Municipal Research; editor of *Political Science Quarterly*. Author: "Railway Tariffs"; "Finance Statistics of American Commonwealth"; "Shifting and Incidence of Taxation"; "Progressive Taxation in Theory and Practice"; "Essays in Taxation"; "Two Chapters on Mediæval Guilds of England"; "Economic Interpretation of History"; "Principles of Economics." Address: Columbia University, New York City.

SENIOR, NASSAU WILLIAM: Political economist; born at Offington, Berkshire, 1790. Educated at Eton and Oxford; commenced the practise of law in 1810. Appointed professor of political economy at Oxford in 1826; was made secretary of the House of Lords in 1836, and was member of various commissions and societies. Interested in Eastern studies. Correspondent of the Institute of France (1843) and author of several reports and articles on industrial questions, mainly published in the *Quarterly Review*, the *Edinburgh* and *London Reviews*. Was the author of the now nearly discarded wage-fund theory (see *WAGES*). Author: "Lectures on Political Economy"; "An Outline of Political Economy," which first appeared in the "Encyclopédie Méropolitaine" (1850). Died, London, 1864.

SETTLEMENTS (SOCIAL, UNIVERSITY, COLLEGE, AND CHURCH): One of the earliest definitions of a settlement and one which still holds good is that given by Miss Ada S. Woolfolk in "Johnson's Encyclopedia." She defines settlements as "homes in the poorer quarters of a city where educated men and women may live in daily personal contact with the working people." Here they may identify themselves as citizens with all the public interests of the neighborhood, may co-operate with their neighbors in every effort for the common good and share with them, in the spirit of friendship, the fruit and inspiration of their wider opportunities.

Miss Jane Addams, of Hull House, puts concisely the social significance of settlements as

"a sustained and democratic effort to apply ethical convictions to social and industrial conditions in those localities where life has become most complicated and difficult." She says further: "The settlement movement is only one manifestation of that wide humanitarian movement which throughout Christendom, but preeminently in England, is endeavoring to embody itself not in a sect but in society itself. Certain it is that spiritual force is found in the settlement movement, and it is also true that this force must be evoked and must be called into play before the success of any settlement is assured. There must be the overmastering belief that all that is noblest in life is common to men as men, in order to accentuate the likeness and ignore the differences which are found among the people the settlement constantly brings into juxtaposition. It aims in a measure to lead whatever of social life its neighborhood may afford, to focus and give form to that life, to bring to bear upon it the results of cultivation and training; but it receives in exchange for the music of isolated voices the volume and strength of the chorus. The settlement, then, is an experimental effort to aid in the solution of the social and industrial problems which are engendered by the modern conditions of life in a great city. It insists that these problems are not confined to any portion of a city. It is an effort to relieve, at the same time, the overaccumulation at one end of society and the destitution at the other; but it assumes that this overaccumulation and destitution is most sorely felt in things that pertain to social and educational advantages" ("Philanthropy and Social Progress," pp. 19-30).

Principles

The development of the settlement idea has been gradual. In 1860 Frederic Denison Maurice founded the Working Men's College, whose classes

were taught by young Cambridge graduates in their leisure hours. In 1867 the university extension movement began in Cambridge. Owing to the influence of Rev. John Richards Green, vicar of St. Philip's, Stepney, and better known as the historian of the English people, Edward Denison made his home in 1867 in East London, but his health failed and he came to an early death. In 1875 Arnold Toynbee resolved to spend his summer vacation in Whitechapel in assisting the Rev. S. A. Barnett of St. Jude's. In 1883 Arnold Toynbee died, but two years later, through Canon Barnett, who had already been ten years in Whitechapel, Toynbee Hall, the first university settlement, was founded by Oxford men. In 1887 Dr. Stanton Coit established the Neighborhood Guild in New York. This became later the University Settlement. In 1889, at almost the same time, the College Settlement, with Miss Jean Fine (now Mrs. Spahr) as head worker and with Miss Vida D. Scudder as one of its chief inspirers, was opened in New York, and Miss Jane Addams and Miss Ellen Gates Starr took up their residence at Hull House, Chicago. From that time the growth has been rapid until there are over two hundred reported in the United States. Settlements are to be found in Australia, Japan, the Philippine and Hawaiian Islands, and in Austria, Germany, France, and Holland, as well as the mother country, Great Britain. There are also settlements for rural communities both in New England and the Southern states.

History

Not only are there many houses which bear the name of settlement, but settlement methods have been adopted by missions, churches, and training-schools of various kinds, so that the name has lost much of its original significance. In spite of the looseness in the use of the name and idea, which is perhaps more or less inevitable, so much of what is good has permeated the life and activities of many institutions that it is evident that the indirect influence of settlements is a factor not to be ignored. There are settlements with no residents that have more truly the settlement spirit than many another with a number of resident workers. There are settlements with a definite propaganda which touch the life about them more closely than others that claim to hold themselves open to every desire of the neighborhood, regardless of creed, race, or sex. There seems, however, to be a growing tendency on the part of those longest interested in settlements to go back to the original spirit underlying their beginnings and to deplore the tendency to institutionalism. A happy mean is struck by Canon Barnett in his "Fifteenth Annual Report" (June 30, 1899) when he says:

Toynbee Hall exists that individuals may tell on individuals, that the knowledge accumulated in the universities and the experience accumulated in industry may move public opinion through the friendships formed between university men and the inhabitants of industrial neighborhoods. But such friendships are sure to lead to organizations. When two or three meet together and in the presence of the higher ideal which appears in their midst see the ignorance or the suffering of the sin which is around, they cannot help starting the machinery by which that good-will may become effective.

Mrs. Simkovitch, of Greenwich House, New York, urges that settlement workers do

"not make of the home center a noisy clubhouse filled with various hybrid educational and social activities that will gradually drive out the simple home life, without which a settlement is devoid of that spirit that alone can render it permanently useful in the neighborhood as a stimulus toward

generally improved conditions; for a settlement is primarily a stimulus and only secondarily an institution. Institutional features must be undertaken by a settlement only when it is impossible for the settlement to get anybody else to undertake them" ("Report of Greenwich House," Jan., 1903).

Also: "The essence of settlement work is freedom to meet a new opportunity, and this elasticity is difficult to combine with a highly developed institution. This does not mean that institutional work has not its place and value in settlement activities, but it does mean that the institution ought never to strangle the fresh opportunities that are constantly springing up from the social life of a neighborhood such as ours. The settlement is founded on a belief that the springs of beauty of character and of the best social development are to be found in the lives of our working people, and that, firm in that belief, it is our duty and privilege to work with them, so to change the outer conditions of their lives that those inner springs will have a chance to develop" ("Report of Greenwich House," Oct., 1900).

The number of settlements as now reported is as follows: Asia, 1; Australia, 1; Austria, 1; England and Wales, 56; France, 4; Germany, 2; Holland, 11; Scotland, 10; the U. S., including the Hawaiian and Philippine Islands and representing thirty-one states, 207; a total of 293.

While there are settlements in a number of the smaller cities and towns of England, the movement has settled in London where it began. The chief inspiration has come in many instances from the universities (Oxford and Cambridge) whether shown in the first settlement, Toynbee Hall, in Oxford House, St. Margaret's House, Cambridge House, or in the settlements of the Congregationalists, Mansfield House and Robert Browning Hall. The influence of Canon Barnett, who stands

Other Countries "for the way of life as distinct from the way of machinery," has been most marked, not alone in London and England, but wherever the settlement idea has taken root.

In Paris the settlements have tended to the educational side. As a rule, the residence plan has not been successfully carried out, but whereas at first sight the Paris settlements might seem to be allied to university extension yet they are "so primarily social and the relation between 'workers' and the people is so natural, wholesome, and mutually helpful," that they are really closely akin to settlements. In Holland there is but one residence worker in the eleven settlements, and those who are carrying them on are apt to protest that they are not really settlements. However, almost all the "people's houses" seem to have drawn their inspiration directly from Toynbee Hall and the teachings of Ruskin.

It is in the U. S., however, that settlements have had their most varied and largest growth. There are many institutions which have assumed the name without having much if any right to it. There are a number of interesting experiments in bringing the settlement ideas into rural communities. In spite of some feeble and unworthy efforts, the strength and wide influence of such settlements as the South End House, Boston; the group of settlements carried on by college women under the College Settlements Association in Boston, New York, and Philadelphia; the University Settlement, Greenwich House, and the Nurses' Settlement in New York City; Whittier House in Jersey City; the University Settlement, the Commons, of Chicago, and many others throughout the country make the name an honorable one. Preeminent above all is Hull House, of Chicago, under the leadership of Miss Jane Addams, "the most successful settlement in the world," according to Canon Barnett (see HULL HOUSE). In reality the Hull House is not only one of the most important factors in the higher

life of Chicago, but its influence has reached far beyond its own city.

As regards the present status of settlements,

"several difficulties are met with in attempting to realize their ideals: (1) Many of the residents do not come to settle but to spend a limited number of months in the hopes of doing a little and learning much. (2) Nearly every settlement is compelled through periodical statistical reports to justify its existence in the eyes of outside subscribers. (3) From these facts of transient workers and tabulated

reports there follows as a necessary evil the wide-spread tendency to employ machinery in order to produce effects. . . . So long as 90 per cent of the residents turn their backs on the colony as soon as they have gained enough experience to be valuable, not very extensive results can be hoped for" (E. J. Ulrick in *Charity Organization Review*, London, Dec., 1903).

From another authority we have this opinion: "Settlements are still experiments. They are far from having reached the clear waters of an assured position, but are a success if only because they have evidenced out the idea and given new form to the practise of neighborliness and have thus made for social solidarity. They do not perhaps necessarily represent so high a personal ideal as that of Edward Denison, who lived alone in a poor street in East London; but they are more practical than isolated effort and in spite of the drawbacks of community life and the artificialities and partial separation from ordinary social life which are involved. They give scope for the very effective concentration of many minds on one general aim. Their stability in the future depends on the amount of personal service they can secure of the kind that is needed" (Charles Booth, "Life and Labor in London," Third Series, vol. vii.).

STATISTICS

We print as follows statistics of settlements in the U. S. It is not a complete list, but is a very large proportion of the whole. From statistics gathered for "Social Progress," 1906, it appears that in that year 837 persons were residents in settlements besides those not reporting. Besides these, 3,907 more (977 men and 2,930 women) non-residents aided in settlement work, making 1,188 men and 3,556 women, or 4,744 engaged in settlement work. Of these, 603 (497 women and 106 men) gave all their time to the work. They reported 1,568 clubs and 1,502 classes, reaching some 55,000 different persons, of whom 9,000 were men, 15,000 were boys, and 31,000 girls or women. Of the 170 settlements, 63 (probably the largest) reported property valued at \$2,827,000, and 86 settlements reported annual expenditures of \$459,000.

SHACKLETON, DAVID JAMES: English Labor M. P.; born 1863, in Rosendale. Mr. Shackleton is a weaver and active trade-unionist. He was elected to Parliament for the Clitheroe Division of Lancashire in 1902. He is vice-chairman of the Labor Party in the House of Commons, and president of the Northern Counties Weavers' Amalgamation; and member of the Legislative Council of the Textile Factory Workers' Association. He is chairman of the Parliamentary Committee of the Trade-Union Congress. Member also of the Blackburn Chamber of Commerce. Address: 51, London Terrace, Darwen, Lancashire, England.

SHAFTESBURY, ANTHONY ASHLEY COOPER, SEVENTH EARL OF: "The Workingman's Friend"; born in London, 1801. Educated at Chiswick, Eton, and Oxford, where he took a first class in classics in 1822. Entered Parliament in 1826, representing Woodstock 1826-30, Dorchester 1830-31, Dorset 1833-46, and Bath 1847-51. He supported the administrations of Liverpool and Canning; commissioner of the India Board of Control (1828), Lord of the Admiralty under Peel. He succeeded his father in the peerage in 1851. Altho a Tory, he was independent. Commenced public labors for reform in 1828 by his speech on the barbarous treatment of lunatics, and was mainly influential as chairman of the Lunacy Commission in securing the bill which has been called "the Magna Charta of the liber-

ties of the insane." By 1833 he became, largely through the influence of Oastler (*q. v.*), the acknowledged parliamentary champion of factory legislation (*q. v.*); costing him political preferment, but earning him the title of "The Workingman's Friend." Worked incessantly in the ten-hours movement. Made numerous personal investigations of factories and factory life; and his revelations caused all England to shudder. The Children's Employment Commissions of 1842-43 were mainly due to him. He secured the passage of the Factory Act of 1844 and the famous Ten-Hour Act of 1847. Evangelical of the Evangelicals, he incurred opprobrium, contempt, and misrepresentation, yet was president of numerous Bible societies and head of the so-called Exeter Hall school of Low Churchmen. He was an active opponent of slavery throughout the world till his death in 1885.

SHAKERS is the name commonly given to a religious community of people in the United States. Their official name is United Society of Believers in Christ's Second Appearing. The name Shakers was applied to their forerunners and successors of the French Prophets, under the ministrations of James and Jane Wardley, Quakers of Bolton, England, because of the shaking of their bodies by the power of God in their seasons for worship.

It was accepted because appropriate to the work God promised to do in the latter day. "In that day, there shall be a great shaking in the land of Israel. All men upon the face of the earth shall shake in my presence." (Ezek. 38:20; Joel 3:16.) "I will shake all nations and the desire of all nations shall come." (Hag. 2:6.) Also because the Spirit that inspired the prophets, said the shaking of their bodies was a sign that He was now going to do what He had foretold in His word, and what they were sent before to warn of, to wit: "He is coming to shake terribly the earth—to shake not only earth but heaven also, and to make the hearts of sinners fear and tremble more than the bodies of His messengers do now." (London, 1708. Pamphlet 2,516, New York State Library. See Heb. 12:26.)

The founder of this brotherhood and sisterhood, in whom the Shakers believe that Christ has made his second appearing, was an Englishwoman named Ann Lee, a native of Manchester, to whom, after a labor of twelve days and nights, to know how creation was fallen and how the restoration should take place, Christ appeared in His kingdom and glory, and revealed the depth of man's loss, what it was, and the way of redemption. This was in the summer of 1770, ten years after she had joined the Society of the Wardleys, which had already received the name Shakers.

From this time onward Ann became the acknowledged leader of the society. Her testimony cutting off the carnal union between male and female, demanding pure sex relations, reduced, however, their number from about 300 to 30. Ann said she joined that society about the year 1760, at 23 or 24 years of age. She was a married woman, in the vigor and prime of life, had a robust constitution, and had four children (all of whom died in infancy). In her younger days, even while a child, she had an utter hatred of that nature which leads mankind to works of uncleanness. She made this known to her parents, many times, but having the same nature as

others, and no one to support her innate principle, after she grew up, she declined and became, for a time, a prey to the Destroyer.

She said further:

"God created my soul in innocence, but by sinning against His holy commandments, I was defiled and abominable in His sight. While in that state, God was pleased to call my soul by the Gospel. I was wrought upon by the power of the Holy Spirit, to see and feel the depth of my loss, and by the same power, I was enabled to travel out of it." Concerning her interview with the Lord Jesus, she says: "Then I was made able to hear an open testimony against that sin which is the root of all evil, and I felt the power of God flow in my soul like a fountain of living water. From that day to this, I have taken up a full cross against the doleful works of the flesh."

As the first man was not complete till woman was created and placed in her proper order as his chief helper and coworker, so also with Him that was to come. The Lord from heaven, the life-giving Spirit, was not completely revealed, till the new woman was created on the same spiritual plane, in the likeness of the Eternal Mother, and had traveled to her lot to personate the Bride of the Lamb, and reveal the Mother in Deity, as Jesus personated the Bridegroom and revealed the Father. Less than this destroys semblance between type and antitype. God is Father and Mother—and Christ is Father and Mother in Son and Daughter.

Quakers, French Prophets, and the Wardleys all prophesied of the second coming of Christ to set up his everlasting kingdom, as near at hand, and the destruction of the kingdom of Antichrist, and all the corrupt systems of men—and the fulfilment of ancient prophecy concerning the marriage of the Lamb, and descent of the New Jerusalem. Ann of course became imbued with the same thought, but her first travail was for her own redemption and purification from the nature of evil.

Ann was born Feb. 29, 1736. Her father, John Lee, was a blacksmith, and had eight children. One of these united with her, threw up his commission as an officer in the king's guards, and earned support at blacksmithing. He traveled with her and was a strong support till the end of earth's trials. Ann lived in the house with her father, till she embarked for America. She grew up at work, and without schooling in books. She was patient, industrious, neat, and frugal, and taught her followers to practise the same. An instruction of hers, often repeated by her disciples, was: "Put your hands to work and give your heart to God." She did not profess to teach a new doctrine, i. e., a different one from the teachings of Christ as recorded in the New Testament, but directed her hearers to Him as the true guide and enlightener, and example for all to follow.

Altho violently assaulted a number of times in England, and afterward in America, with apparent intent to kill, and tho her followers were roughly handled in both countries, it was not to escape persecution that she came to America. Persecution had ceased in England nearly two years before she came. It was because the people there were not sufficiently disenthralled to receive her testimony. Ann was directed by revelation to come to America, where she saw the future increase of the work, among a people she was told would be prepared to receive her testimony.

Nine persons, including Abraham Stanley, her husband, embarked on a condemned ship, the *Mariah*, in 1774. When told that the vessel was

condemned, Mother Ann said, "God will not condemn it when we are in it." They landed safely in New York Aug. 6th, after being, as they believed, miraculously saved, and immediately sought employment. Ann remained in New York, a man having employed her husband at blacksmithing. Stanley, however, about a year after, began to oppose her views and deserted her in 1775, and we hear no more of him.

John Hocknell was the only man of wealth among her group of followers. It was his means that enabled them to emigrate, and they now leased a tract of land in the wilderness of Water-vliet, seven miles northwest of Albany, N. Y., where they settled in 1776. Here they toiled to clear the land, build houses, and lay in stores for the anticipated increase. In the spring of 1780 the news spread among a people prepared in eastern New York and New England, of a strange people having a strange religion, living in the woods, near Albany. Converts were made.

The first public testimony of the everlasting Gospel, preached in America, was on the well-known dark day of May 19, 1780. In 1781 Ann made a missionary tour through New England and elsewhere. In six years' time nearly 3,000 people embraced the testimony and came to judgment, confessing and righting their wrongs. Mother Ann died in 1784, but her successors, Joseph Meacham and Lucy Wright, began, in 1793, to organize the believers into families on a communal basis, after the example of the Primitive Church at Jerusalem, but with increase, giving woman equal place, honors, office, rights and privileges with the man. The work of organizing all the families occupied five or six years, or till 1793.

The earliest census known to the writer is dated 1803. The number of the fraternity at that time was 1,632, in eleven societies—two in Maine, two in New Hampshire, four in Massachusetts, one in Connecticut, and two in New York. In 1805 three missionaries were sent from Mt. Lebanon to the subjects of the Kentucky revival. Later more laborers were sent, both brethren and sisters, perhaps twenty in all, and five new societies were established—two in Ohio, two in Kentucky, and one in Indiana, afterward broken up on account of unhealthy location, the people moving to other societies.

By 1830 believers had increased threefold; two more societies were established in Ohio, and one in New York. In 1806 a family was settled on a tract of land in Osceola County, Florida; a few colonies have since been given up, but there are still fifteen societies or settlements, comprising twenty-seven family communities, and numbering near 700 people.

Their number when largest, from 1838 to 1845, was about 4,000. From 1837 to 1850 a marvelous spiritual outpouring and visitation of spirits caused a deep and lasting spiritual revival in all the societies. Mother Ann and her collaborators and successors in the ministry and eldership appeared to be the conductors of it fifty-three years after she left the mortal body. They came to awaken the people—to purge out disorder and slackness—to plant faith in the young, of whom there was a large company, and to baptize them with spiritual gifts and power from on high. They did not come to take the lead, but to help the elders, and to reestablish Christian order as it was in the beginning, and prepare for the Gospel to go forth to mankind.

Sept. 21, 1850, one inspired Harriet (Goodwin), in the name of Mother Ann, testified that at that time the power of evil was more bound, and less able to act against the work of God than ever before. That the inhabitants of Zion stood in a more purified and justified state than they did before, and the prevailing feeling was united to keep the Gospel. The declared purpose of the Spirit was in a degree accomplished. Many were baptized with a holy Spirit and became pillars, who but for that work would have remained of the earth, earthy, fulfilling the desires of the natural mind. This was done while many were in the body who received their faith from Mother Ann and her helpers, William, James, and John. She could prove by them, it was her that spoke through the lips of the young who were not born, nor their parents, when Mother Ann passed out of the body. However, a wave of caviling infidelity and disbelief in spiritual gifts followed and swept many from the ranks.

After the close of 1851 those who remained of the first believers passed away very fast, and from that day to this there has been a steady decline in the number forming the visible body.

Elder James Whittaker, her principal preacher, who succeeded her in the ministry, died in 1787, aged 36. He was succeeded by Elder Joseph Meacham, born in Enfield, Conn. He passed on, in 1796, aged 54. All these, and Elder John Hocknell, who passed on in 1799, aged 76, were spirit seers, prophets, and had visions of the heavenly world. After Joseph Meacham, Mother Lucy Wright, who was chosen Leader of the Sisterhood from 1787, guided the people through their great increase till 1821, when she passed on at the age of 61. After that Ebenezer Bishop, Rufus Bishop, Ruth Landon, and Ascenath Clark were the first ministry till 1849. Elder Ebenezer passed on in 1849, Ruth Landon in 1850, and Rufus Bishop in 1852. After some changes, Daniel Boler and Giles Avery, Betsy Bates, and Eliza Ann Taylor, led the people till 1890. Present leaders are Joseph Holden, Harriet Bullard, and Augusta Stone. They divide their time between Mt. Lebanon, Watervliet, Hancock, and Enfield, Conn., Elder Joseph giving most of his time to Shirley and Hancock.

A. G. HOLLISTER,
Mt. Lebanon, Columbia Co., N. Y.

There are now some fifteen societies, located in New York, Massachusetts, New Hampshire, Ohio, Kentucky, Connecticut, and Maine. Each society is constituted of several families, each family being a community in itself, having its own lands, buildings, and business. In Mt. Lebanon, N. Y., their largest community, there are several families, made up of 150 persons, including thirty-five boys and girls. This has been the home of Elder Frederick W. Evans, the best known of the Shakers. The other societies are made up in about the same ratio as the one at Mt. Lebanon.

The capital of all the communities is mostly in land. Originally the communities invested their surplus income in land; now they are selling it off as fast as they can find purchasers. For many years broom-making, gardening, seed business, medicines, etc., were profitable industries. One of their number says the income of all the communities does not any more than balance the expenditures in taxes, repairs, living, com-

forts, and improvements; but that having good simple food and hygienic clothing, with useful buildings supplied with modern conveniences in heating, lighting, sanitation, and hygiene, they have a heaven upon earth, and are therewith content.

Their society is recruited mostly by young men and girls, but occasionally married persons with their children come "into union." Husbands and wives, when they have come "into union," become as brothers and sisters. The education of the children attached to the society is the work of the sisters. The brothers and sisters take their meals in a common room, eating at six in the morning, at noon, and at six in the afternoon. Their meals are taken in silence, any direction that has to be given being given by a gesture or in a whisper. In their church service music bears a prominent part, the hymns and chants which are used being all of Shaker origin, communicated to believers in dreams and reveries by the spirits with whom they have communion.

SHAW, ALBERT: Editor *American Review of Reviews*; lecturer and publicist; born in 1857, at Shandon, Iowa. Educated at Grinnell and Iowa Colleges, Iowa (1879), took postgraduate work at Johns Hopkins University, where he studied history and political science, and received the degree of Ph.D. in 1884, LL.D. University of Wisconsin, 1904. For a time he was editorial writer on *The Minneapolis Tribune* (1883-86), and studied in Europe, 1888-89. In 1891, associated with W. T. Stead, he established and has since edited *The American Review of Reviews*. He has lectured in many universities, colleges, and clubs on political topics, and is a member of numerous scientific societies and clubs—literary and political. He is author of "Icaria" (q. v.), 1884; "Cooperation in the Northwest" (1888); "Municipal Government in Great Britain" (1895); "Municipal Government in Continental Europe" (1895); "Political Problems of American Development" (1907); "The Outlook for the Average Man" (1907); edited *The National Revenues* (1888), and has written numerous essays on political and economical topics, and on municipal ownership. Address: 13 Astor Place, New York City.

SHAW, GEORGE BERNARD: Author, critic, playwright, Socialist; born in Dublin, 1856. In 1876 he settled in London and wrote four novels, "The Irrational Knot," "Love Among the Artists," "Cashel Byron's Confession," and "An Unsocial Socialist." In 1884 he joined the Fabian Society (q. v.), one of its earliest members, and has continued active in its management to the present, editing and contributing to "The Fabian Essays," whilst writing criticisms of painting, music, the drama and literature continuously for the press and lecturing in the evenings on socialism. He has since 1892 written fifteen plays, which have been translated into eighteen languages, and performed with success in most of them. "Mrs. Warren's Profession" is perhaps, the best known instance of his method of substituting the collective guilt of society for individual delinquency in motivating his pieces.

That he is serious in his socialism and has put much of it into his plays, those who know him best have no question. His religious and political philosophy is to be found in the prefaces of his plays—notably "Man and Superman" and in such essays as "The Quintessence of Ibsenism" (1891) and "The Perfect Wagnerite" (1898). Address: 10 Adelphi Terrace, W. C., London, England.

SHEARMAN, THOMAS GASKELL: Lawyer and political economist; born in 1834 at Birmingham, England. He came to the United States in 1843, and was admitted to the bar in 1859, but did not practise until 1868, devoting himself meanwhile to writing on law. In 1874 he defended Henry Ward Beecher against Theodore Tilton. He belonged to the Republican Party except during 1884-96, but was all the time a free trader, opposer of indirect taxation, and believer in the single tax. Died 1900. He was author of (books and articles) "Talks on Free Trade" (1881); "Distribution of Wealth" (1887); "Owners of the U. S." (1889); "The Coming Billionaire" (1890); "Crooked Taxation" (1891); "Taxation of Personal Property" (1895).

SHERWELL, ARTHUR: Author; social reformer; born London, England, 1863. For a few years a minister in the Wesleyan Church, for theological reasons he resigned, and has since devoted himself exclusively to the study of social questions. Has traveled extensively and investigated social conditions in various countries. In recent years, collaborating with Mr. Joseph Rowntree, he has devoted much time to a study of the social and legislative aspects of the temperance question. Mr. Sherwell is an advanced social reformer and in full sympathy with the labor movement, but insists that the social problem is not a mere question of poverty or overcrowding or unemployment, but of the development of man. He holds that social progress can only spring from the release and development of latent forces in human nature and that everything that hinders this release and development is necessarily a fundamental problem of politics. Author: "Life in West London"; "Social Settlements and the Labor Movement." Joint author of "The Taxation of the Liquor Trade"; "Public Control of the Liquor Traffic"; "The Temperance Problem and Social Reform," etc. Address: Crossways House, Lower Kingswood, Reigate, England.

SHIBLEY, GEORGE H.: Sociologist; born 1861, Randall, Wis.; studied law in Chicago; admitted to Illinois bar 1887; took special courses at University of Chicago 1893-95; student and writer on monopoly problem, the initiative and referendum; founded Bureau of Economic Research in 1899; and, in 1902, the National Federation for People's Rule. Mr. Shibley believes that the people should seek to terminate "machine rule" by reestablishing a system by which they can vote directly on legislative issues. The people's rule reestablished, they can vote as they choose; as, for example, is being done in Oregon, in Los Angeles, and in other places. Author: "Elements of Law"; "Money Question"; "The Monopoly Question"; "Outline of Social Evolution"; "The University and Social Problems"; "The Trust Problem Solved"; "Guarded Representative Government." Address: Bliss Building, Washington, D. C.

SHIPPING: The following table of the merchant marine of the world is taken from the "Statistisches Jahrbuch für das Deutsche Reich," 1906:

House. Mr. Siegfried is one of the prominent social reformers in France. President of the *Musée Social*, and framer of the Law on Cheap Dwellings,

¹ The smaller vessels, sail or steam, are not included; but the difference of "small" varies somewhat, e.g., Belgium and Spain do not report vessels under fifty tons, the U. S. omit those under five tons.

² The ships include only those built after European patterns.

SIDGWICK, HENRY: Political economist; born Skipton, Yorkshire, England, 1838; educated at Rugby and at Trinity College, Cambridge. Became a fellow and lecturer of his college in 1859; he resigned the fellowship in 1869 on account of the conditions of religious belief then attached to fellowships; in 1870 was active in establishing academic instruction for women in Cambridge. Appointed professor prelector of moral philosophy at Trinity College in 1875, and Knightsbridge professor of moral philosophy in the University of Cambridge in 1883. He has contributed to periodical literature many articles on philosophical and economical subjects. In his philosophical works he seeks to reconcile lines of thought previously regarded as antagonistic; in ethics to reconcile intuitionism and utilitarianism. In political economy his endeavor was to find the right compromise between, or combination of, the traditional deductive method of English political economy and the views of the men sometimes called Socialists of the Chair, predominant in Germany. Died in 1900. Author: "Methods of Ethics"; the "Principles of Political Economy"; "Outlines of the History of Ethics"; "Elements of Politics."

SIEGFRIED, JULES: Member of the French Chamber of Deputies; born 1837 at Mulhouse, Alsace. Engaged in the cotton business at Mulhouse, then at Bombay and Havre, where he developed a large trade, especially during the American War. During the Franco-German War he entered political life, becoming adjoint to the Mayor of Havre—a position he held from 1871 to 1878. Mayor of Havre from 1878 to 1885, in which office he made a great reputation as an active, energetic administrator and bold reformer. In 1885 appointed deputy to the Lower House, and in the Ribot ministry, 1892, was Minister of Commerce. Elected to the Senate in 1897. In 1902 was again elected to his seat in the Lower

House. Mr. Siegfried is one of the prominent social reformers in France. President of the *Musée Social*, and framer of the Law on Cheap Dwellings,

often called the "Siegfried Law." A Republican and a supporter of the policy represented by the Left side of the House of Deputies, and, tho a believer in individual effort, M. Siegfried in social matters has in many cases given his support to the intervention of the State. Author of the book "La Misère," which has been crowned by the French Academy; also of numerous pamphlets on social questions. Address: 226 Boulevard Saint Germain, Paris, France.

SIMONS, ALGIE MARTIN: Socialist; editor; born 1870, North Freedom, Wis. Graduated from University of Wisconsin, 1895, with honors in economics; 1895-9 was engaged in social settlement and associated charity work. Mr. Simons has been for some years editor of the *International Socialist Review*. He is a professed adherent of the principles of international Marxian socialism. Author: "The American Farmer"; "Class Struggles in America"; "The Man Under the Machine"; "Packington," and many pamphlets and minor articles. Address: Gladstone Apartments, Evanston, Ill.

SINCLAIR, UPTON: Socialist; author; born 1878, Baltimore, Md.; educated at College of City of New York and Columbia University. During the years 1905-6 he conducted a personal and thorough investigation into the actual conditions of the packing industry of Chicago and wrote a novel about it, "The Jungle." The book made such a stir that President Roosevelt was moved to institute an investigation into the matter which has resulted in a radical reform in the meat-inspection laws. Mr. Sinclair is a member of the Socialist Party and is in full sympathy with the international revolutionary Socialist movement. Latterly he has founded Helicon Hall (q. v.). Author: "The Industrial Republic"; "The Overman"; "The Jungle"; "The Metropolis." Address: Box 2064, New York City.

SINGER, PAUL: Socialist and manufacturer; born Jan. 16, 1844, in Berlin; in 1858 he was apprenticed to a merchant; in 1869 he and his brother established a factory for women's cloaks. He left the *Fortschritts Partei* in 1870, and turned Socialist. He has been a member of the Reichstag since 1884 as a Socialist. Since 1887 he has devoted his entire time and means to agitation in behalf of social democracy, and, with Bebel, is one of the chairmen of the central committee of the party. He has also been a member of the municipal board of Berlin since 1884. Address: Lindenstrasse, 44, Berlin, S. W., Germany.

SINGLE TAX, THE: A statement of the fundamental principles of the reform bearing the name of the Single Tax, and prepared for the *Financial Reform Almanack* of England, for the year 1891, by the great apostle of the movement, Henry George, is herewith presented. For a necessarily brief exposition, nothing more comprehensive and authoritative has been written. Speaking for himself and his associates, Mr. George says:

"We propose to abolish all taxes save one single tax levied on the value of land, irrespective of the value of improvements in or on it.

"What we propose is not a tax on real estate, for real estate includes improvements. Nor is it a tax on land, for we would not tax all land, but only land having a value irrespective of its improvements, and would tax that in proportion to that value.

"Our tax involves the imposition of no new tax, since we already tax land values in taxing real estate. To carry it out we have only to abolish all taxes save the tax on real estate and to abolish all of that which now falls on buildings or improvements, leaving only that part of it which now falls on the value of the bare land. This we would increase so as to take as nearly as may be the whole of the economic rent, or what is sometimes styled the 'unearned increment of land values.'

"That the value of land alone would suffice to provide all needed public revenues—municipal, county, and national—there is no doubt. To show briefly why we urge this change, let me treat (1) of its expediency and (2) of its justice.

"(1) It would dispense with a whole army of tax-gatherers and other officials which present taxes require, and place in the treasury a much larger proportion of what is taken from the people, while, by making government simpler and cheaper, it would make it purer. It would get rid of taxes which necessarily promote fraud,

perjury, bribery, and corruption; which lead men into temptation, and which tax what the nation can least afford to spare—honesty and conscience. Since land lies out of doors and cannot be removed, and its value is the most readily ascertained of all values, the tax to which we would resort can be collected with the minimum of cost and the least strain upon public morals.

"It would enormously increase the production of wealth:

"A. By the removal of the burdens that now weigh upon industry and thrift. If we tax houses, there will be fewer and poorer houses; if we tax machinery, there will be less machinery; if we tax trade, there will be less trade; if we tax capital, there will be less capital; if we tax savings, there will be less savings. All the taxes, there-

fore, that we would abolish are taxes that repress industry and lessen wealth. But if we tax land values, there will be no less land.

"B. On the contrary, the taxation of land values has the effect of making land more easily available by industry, since it makes it more difficult for owners of valuable land, which they themselves do not care to use, to hold it idle for a larger future price. While the abolition of taxes on labor and the products of labor would free the active element of production, the taxing of land values in taxation would free the passive element by destroying speculative land values and preventing the holding out of use of land needed for use. If any one will but look around to-day and see the unused or but half-used land, the idle labor, the unemployed or poorly employed capital, he will get some idea of how enormous would be the production of wealth were all the forces of production free to engage:

"C. The taxation of the processes and products of labor on the one hand, and the insufficient taxation of land values on the other, produces an unjust distribution of wealth which is building up in the hands of a few fortunes more monstrous than the world has ever before seen, while the masses of our people are steadily becoming relatively poorer. These taxes necessarily fall on the poor more heavily than on the rich; by increasing prices, they necessitate larger capital in all businesses, and consequently give an advantage to large capitals; and they give, and in some cases are designed to give, special advantages and monopolies to combinations and trusts. On the other hand, the insufficient taxation of land values enables men to make large fortunes by land speculation and the increase in ground values—fortunes which do not represent any addition by them to the general wealth of the community, but merely the appropriation by some of what the labor of others creates.

"This unjust distribution of wealth develops on the one hand a class idle and wasteful, because they are too rich, and on the other hand a class idle and wasteful, because they are too poor—it deprives men of capital and opportunities which would make them more efficient producers. It thus greatly diminishes production.

"D. The unjust distribution which is giving us the hundredfold millionaire on the one side, and the tramp and the pauper on the other, generates thieves, gamblers, social parasites of all kinds, and requires large expenditure of money and energy in watchmen, policemen, courts, and prisons, and other means of defense and repression. It kindles a greed of gain and a worship of wealth, and produces a bitter struggle for existence which fosters drunkenness, increases insanity, and causes men whose energies ought to be devoted to honest production to spend their time and strength in cheating and grabbing from each other. Besides the moral loss, all this involves an enormous economic loss which the single tax would save.

"E. The taxes we would abolish fall most heavily on the poorer agricultural districts, and thus tend to drive population and wealth from them to the great cities. The tax we would increase would destroy that monopoly of land which is the great cause of that distribution of population which is crowding people too closely together in some places and scattering them too far apart in other places. Families live on top of

one another in cities, because of the enormous speculative prices at which vacant lots are held. In the country they are scattered too far apart for social intercourse and convenience, because, instead of each taking what land he can use, every one who can grabs all he can get, in the hope of profiting by the increase of value, and the next man must pass farther on. Thus we have scores of families living under a single roof, and other families living in dugouts on the prairies afar from neighbors—some living too close to each other for moral, mental, or physical health, and others too far separated for the stimulating and refining influences of society. The waste in health, in mental vigor, and in unnecessary transportation results in great economic losses which the single tax would save.

"(2) Let us turn to the moral side, and consider the question of justice. The right of property does not rest on human laws; they have often ignored and violated it. It rests on natural laws—that is to say, the law of God.

Justice

It is clear and absolute, and every violation of it, whether committed by a man or a nation, is a violation of the command, 'Thou shalt not steal.' The man who catches a fish, grows an apple, raises a calf, builds a house, makes a coat, paints a picture, constructs a machine, has, as to any such thing, an exclusive right of ownership, which carries with it the right to give, to sell, or bequeath that thing. But who made the earth that any man can claim such an ownership of it, or any part of it, or the right to give, sell, or bequeath it? Since the earth was not made by us, but is only the temporary dwelling-place on which one generation of men follows another; since we who find ourselves here are manifestly here with the equal permission of the Creator, it is manifest that no one can have any exclusive right of ownership in land, and that the rights of all men to land must be equal and inalienable. There must be an exclusive right to possession of land for one to reap the products of his labor. But this right of possession must be limited by the equal right of all, and should therefore be conditioned on the payment to the community by the possessor of an equivalent for any special valuable privilege thus accorded him.

"When we tax houses, crops, money, furniture, capital, or wealth in any of its forms, we take from individuals what rightfully belongs to them. We violate the right of property, and in the name of the State commit robbery. But when we tax ground values we take from individuals what does not belong to them, but belongs to the community, and which cannot be left to individuals without the robbery of other individuals.

"Think what the value of land is. It has no reference to the cost of production, as has the value of houses, horses, ships, clothes, or other things produced by labor; for land is not produced by man, it has been created by God. The value of land does not come from the exertion of labor on land, for the value thus produced is a value of improvement. That value that attaches to any piece of land means that that piece of land is more desirable than the land which other citizens may obtain, and that people are more willing to pay a premium for permission to use it. Justice, therefore, requires that this premium or value shall be taken for the benefit of all, in order to secure to all their equal rights.

"Consider the difference between the value of a building and the value of land. The value of a building, like the value of goods, or of anything properly styled wealth, is produced by individual exertion, and therefore properly belongs to the individual; but the value of land only arises with the growth and improvement of the community, and therefore properly belongs to the community. It is not because of what its owners have done, but because of the presence of the whole great population, that land in New York is worth millions an acre. This value, therefore, is the proper fund for defraying the common expenses of the whole population; and it must be taken for public use, under penalty of generating land speculation and monopoly, which will bring about artificial scarcity where the Creator has provided in abundance for all whom his providence has called into existence. It is thus a violation of justice to tax labor, or the things produced by labor, and it is also a violation of justice not to tax land values.

"These are the fundamental reasons for which we urge the single tax, believing it to be the greatest and most fundamental of all reforms. We do not think it will change human nature. That man can never do; but it will bring about conditions in which human nature can develop what is best instead of, as now in so many cases, what is worst. It will permit such an enormous production of wealth as we can now hardly conceive. It will secure an equitable distribution. It will solve the labor problem, and dispel the darkening clouds which are now gathering over the horizon of our civilization. It will make undeserved property an unknown thing. It will check the soul-destroying greed of gain. It will enable men to be at least as honest, as true, as considerate, and as high-minded as they would like to be. It will remove temptations to lying, false swearing, bribery, and lawbreaking. It will open to all, even to the poorest, the comforts and refinements and opportunities of an advancing civilization. It will thus, so we reverently believe, clear the way for the coming of that kingdom of right and justice, and consequently of abundance and peace and happiness, for which the Master told his disciples to pray and work. It is not because it is a promising invention or cunning device that we look for the single tax to do all this; it is because it involves a conforming of the most fundamental adjustments of society to the supreme law of justice, because it involves the basing of the most important of our laws on the principle that we should do to others as we would be done by."

Although the present political and social agitation of the land question, now active and increasing in every nation where representative government exists, dates only from the year 1879, when Henry George, the unknown California printer, published his great work, "Progress and Poverty," the primary principles had been already recognized and enunciated by statesmen and thinkers. First among these were the famous physiocrats, to whom Mr. George dedicates his book on "Protection or Free Trade," as follows: "To the memory of those illustrious Frenchmen of a century ago, Quesnay, Turgot, Mirabeau, Condorcet, Dupont, and their fellows, who in the night of despotism foresaw the glories of the coming day."

Historical Development

These economists were far in advance of Adam Smith, desiring the abolition not only of protective duties but all taxes direct or indirect, except a single tax upon land values. In England the true philosophical statement of "The Right to the Use of the Earth" was first popularly presented by Herbert Spencer, in the famous ninth chapter of his work on "Social Statics," published in 1850. At that time the practical applications of the principles enunciated seemed infinitely remote, and were treated as interesting abstract speculations. Since the publication, however, of "Progress and Poverty," which brought the question of land monopoly into a practical relation with politics, making it "a burning question," Mr. Spencer has taken occasion, in his latest volume of "Justice," to modify and apologize for his early utterances. Nevertheless, the original statement stands and will continue to stand as the most complete ethical expression of the subject yet formulated. For a comprehensive consideration of Herbert Spencer's change of attitude, the reader is referred to "A Perplexed Philosopher," by Henry George (1892).

Others also of less note had discerned and enunciated the principle underlying the single tax, but it remained for the author of "Progress and Poverty," by that work of genius, to compel the world's attention to it. For a succinct and orderly idea of the origin and phenomenal growth of the organized single-tax movement, the reader is referred to the files of *The Standard* of New York, whose publication, beginning Jan. 9, 1887, and ending Aug. 31, 1892, covers the pioneer period. Its continuance was not deemed essential, for the reason that the press of the country could no longer avoid the discussion. In its place several journals in different parts of the country now (1894) devote themselves exclusively to the single-tax propaganda.

The ethical statement of the reform seldom meets with objection. It cannot be denied that justice demands equal access to natural opportunity for all human beings who must live upon this earth. It is indisputable that land is a bounty of the Creator and not the product of man; and that all wealth is derived from land by the application of man's labor. This truth once granted, it follows logically that land must be separated from wealth, altho law and custom have mixed the two, confusing private property with natural opportunity. The distinction is clear and simple. What the individual makes is his. What nature supplies is the birthright of all. Hence, land ceases to be rightfully private property. It is for use, not for ownership. The single tax has the distinction of pointing out how, without disturbing existing titles, or weakening possession, or lessening security, justice may be done impartially. Access to land being a common right, private monopoly is a universal wrong, unless the user pays the community for the privilege. As sites vary in desirability, grading from those which are now useless to the New York lot which recently sold at the rate of \$15,000,000 per acre, the difference is distinguished as rent, a value created by the growth of the community and the demand for special situations. This preferential difference, or economic rent, made by and belonging to the people, is a natural fund ample to sustain necessary government. By every one who uses land paying a proper rental for the privilege—not to the landlord, who now claims it, but to the government, who

dispenses it for the general good—substantial equity is secured.

The objections urged against the single tax are various, beginning with an expression of doubt concerning its beneficent working, and ending with the charge of confiscation. Granting that exact results are beyond human power of prediction, it may be safely affirmed that if the principles of the reform are correct, the result may be left to take care of itself. Every great movement in behalf of human welfare, like the abolition of the corn-laws or the emancipation of the American slave, has been forced to meet the same prophecies of evil, duly proved to be groundless.

Objections Answered

As regards "confiscation," to give that name to the action of society in taking the value which it creates and which belongs to it, altho that value has for generations been misappropriated by individuals, is to misuse terms and confuse sacred rights. The single tax aims only to stop the present confiscation. It does not ask indemnity for the past, but security for the future. All it proposes is to take every year that value which society in its collective sense creates during that year, leaving untaxed everything made or produced by the individual.

The advocates of the single tax, while recognizing the justice and propriety of governmental control of certain natural monopolies, such as franchises belonging to all of the people, and now generally bestowed without compensation on private corporations, are by no means Socialists. They would not substitute paternalism for individual freedom. The single tax aims at equality of opportunity and not of possessions. With fair play and an open field, it would trust results. It does not fear competition, but has no faith in the stability of a society where free competition is denied. It repudiates the game where part of the players use loaded dice. It has more faith in the people than in their rulers, and does not think that any combination, whether it calls itself a trust or a government, can manage private affairs half as well as the people can do it themselves. Rather it demands less government and more freedom.

Since the previous matter was prepared, the spread of the single-tax principle over the globe has been marked. New Zealand presents the best practical illustration thus far obtained, altho the small land-value tax and the exemptions from its operation fail to produce results which a thorough application of the single-tax theory would afford. (All unimproved land values not exceeding £500 are exempt; and those not exceeding a value of £1,500 are allowed a deduction of £500.) In 1897, by this exemption, 92,925 landowners, owning an unimproved value of £11,000,810, were untaxed, and 10,113 others, by the second concession, were relieved of taxation on a value of £5,068,000, in violation of the Henry George plan.

Nevertheless, this partial application of land-value taxation has proved distinctly beneficial in the line prophesied. In response to the telegraphed request of Lord Elgin, Colonial Secretary of Great Britain (April 5, 1906), for information available as to the working of taxation on unimproved land, for municipal and State purposes, especially as to "effects on building trade, on rent, on incidence of taxation on

Progress Since 1896

house property and vacant sites respectively, and on land speculation," P. Heyes (F.S.A.A., Eng., Commissioner of Taxes, New Zealand) summarizes results as follows:

Building Trade.—The effect has certainly been to greatly stimulate the building trade. The object and tendency of this system of taxation is to compel land being put to its best use, so that the greatest amount of income may be derived from it, and rendering it unprofitable to hold land for prospective increment in value. It has been the direct cause of much valuable suburban land being cut up and placed on the market, and thus rendered more easily available for residential purposes, and of the subdivision of large estates in the country, resulting in closer settlement.

The effect on urban and suburban land has been very marked. It has compelled owners of these to build or sell to those who would; it has thus caused a great impetus to the building trade. An owner of land occupied by buildings of little value finding that he has to pay the same rates and taxes as an owner having his land occupied by a valuable block of buildings must see that his interests lay in putting his land to its best use. The rebuilding of this city (Wellington), which for some years past has been rapidly going on, is largely attributable to the taxation and rating on land values, so that the supply of building materials could not at times keep pace with the demand.

Rent.—The tendency of this system of taxation is not to increase rent but, on the contrary, as the tax becomes heavier it tends to bring into beneficial occupation land not put to its best use and so reduces rent, the improvements being entirely free from all rates and taxes. In some cases, where land suitable for building sites is limited, high rents have been maintained notwithstanding the tendency of the system.

New Zealand rent, the improvements being entirely free from all rates and taxes. In some cases, where land suitable for building sites is limited, high rents have been maintained notwithstanding the tendency of the system.

Vacant Sites.—The effect has been to cause vacant sites being put to their best use by expenditure on improvements. On vacant sites the rates and taxes are increased and continue to increase as the adjacent sites which have been improved increase in value. It thus becomes unprofitable to continue to hold land unimproved.

Incidence of Taxation.—The taxation on building property, where the improvements exceed the unimproved value, is decreased; where the unimproved value exceeds the improvements the taxation is increased.

Land Speculation.—The tendency is to discourage speculation as the tax partially or wholly discounts the rise in value, but land speculation has not ceased in some districts where the system has been adopted, because:

(1) The tax has not been sufficient to render speculation profitable in the large cities, though it has been a factor to be reckoned with.

(2) The rapid increase in values has caused speculation in spite of the tax.

Land speculation in this colony of late years has chiefly arisen in the purchase of estates which have not presently been put to their best use by the owners, principally consisting of suburban lands, which, after being acquired and improved by subdivision into residential allotments and by roading, result in the extensive building of residences also, in country lands large blocks of land suitable for subdivision into small farms. The effect of this has been rather beneficial than otherwise, because, in addition to the land being put to its best use, it tends to reduce rents and values of residential sites by the large increase of these made available. The form of speculation in land unused and held for a prospective increment is rarely met with in recent years.

(Parliamentary Blue Book Relative to the Working of the Taxation of the Unimproved Value of Land in New Zealand, New South Wales, and South Australia.)

In Australia, South Africa, Russia—where Tolstoy champions the views of Henry George and the peasants are making the land question of first importance—India, Hungary, Denmark, Canada, and the United States the agitation steadily gains. In Great Britain it has reached the practical stage in politics and the taxation of land values is the pronounced program of the present Liberal government and is earnestly urged by the Premier, Sir Henry Campbell-Bannerman. A large majority of the House of Commons in its favor is confidently expected when the question comes up for vote. Already a Scotch bill providing for the separation of land values from improvements and permission to tax land values alone, at a rate not exceeding two shillings (10 per cent) in the pound, has been offered and is waiting its turn for legislative action. In Germany a large number of municipalities and

districts are supported in great part or altogether by revenues derived from lands and utilities publicly owned. Data from fifty-nine districts belonging to fifteen German provinces was obtained in 1892, while others, where the returns from the public lands are said to pay all local rates and taxes, failed to respond.

For illustration, two examples are here given, one rural and one urban. Hagenau (Alsace), a town of about 12,000 inhabitants, obtained £14,256 from its public land. With the addition of the produce of the water system, £1,075, and the gas, £850, sufficient revenue was obtained to make the local rates and taxes practically negligible. Gorlitz (Schlesia) was the most favorable place of all German towns of over 50,000 inhabitants with regard to local rates and taxes. In 1891-92 individual tax came to 8 marks 2 pfennigs; in 1892-93, to 7 mk. 28 pfgs. The details of these and many other places are given by Adolph Damaschke in the August number of *Land and Labor* (London, Eng.). Carried to its ultimate application the system would abolish all taxation, besides enlarging opportunity for labor to employ itself.

A White Paper, giving latest data, issued June 13, 1906, by the German Government, is full of interest. Commenting upon the facts and figures, the *Daily News* (London) of June 14th says: "All the predictions of those who advocate this reform (single tax) are again fulfilled. Before this obvious piece of justice was effected in Germany many owners were paying only a fiftieth of their proper assessment. Since the market-value system was instituted, working-class dwellings have been relieved of from 30 to 40 per cent of their former burdens. Speculation in land has been discouraged, and the supply of land has necessarily become more healthy and useful to builders, tenants, and the community at large."

But more striking than these slow changes of long-fest custom is the revolution of public sentiment regarding Henry George and his theories. He died at the summit of his career, universally honored and lamented. His ideas have become the common coin of economic thinkers, and orthodox professors of political economy no longer wing their shafts of ridicule or denunciation at his principles. Altho the single tax is still often confounded with socialism, it is in reality the extremity of the poles apart. It has no contention with capital or competition, holding both to be natural and beneficent under conditions free from land monopoly. Yet it agrees with the sentiment of Karl Marx, the typical Socialist, that "the expropriation of the mass of the people from the soil forms the basis of the capitalist mode of production"; in other words, the basis of the system under which capital is able to exploit labor. Only free land can make free men.

For a comprehensive discussion of the single tax, touching all points at issue, the reader is referred to the works of Henry George, notably "Progress and Poverty"; "Social Problems"; "Protection or Free Trade"; "The Land Question"; "The Condition of Labor (An Open Letter to Pope Leo XIII.);" and "A Perplexed Philosopher." W. L. GARRISON.

OBJECTIONS TO THE SINGLE TAX

Objections to the single tax usually come from two opposite standpoints, from conservatives who believe in private property in land,

and from Socialists or other radical thinkers, who consider the single tax an inadequate way of meeting the land problem. The two classes of objections may be briefly summarized as follows:

First, conservatives argue against the single tax as in the first place based on false assumptions in justice. Mr. George bases his argument on the assumption that since, to use his words, "Land values arise from the presence of all . . . the land belongs equally to all." This is, of course, a *non sequitur*. The land does not belong equally to all unless its value is contributed to equally by all, which is notoriously not the case. As Mr. Spahr points out in *The Political Science Quarterly* (vol. vi., No. 4), there are many individuals whose presence on land lowers its value, while there are many more whose presence increases land values very slightly. He instances in America the North American Indians, and the Hungarians and Italians who pour into New York City. It depends on how much land is improved, whether the presence of people gives it value. It is even questionable whether, were it not for improvements, land would have any value. Undoubtedly unimproved lots surrounded by improved lots have often immense value, but remove all improvements and how much value would they have? Therefore it is said to tax land values is as much to tax labor as any other tax, and like any other tax to tax an earned increment. Thus, the foundation in justice of the single tax is overthrown.

Secondly, conservatives argue that the single tax is unjust because it distinguishes between forms of labor. Here is a man who has put all his earnings into land; another has invested his in manufactures. Neither themselves work, yet the single tax would take the whole income of the one and not touch the income of the other.

Thirdly, conservatives argue that the single tax would work ill, because it would weaken at its very vital point the sense of private ownership in the soil, which has been the very keystone of society. (For a discussion of this, see LAND.)

Fourthly, conservatives argue that the single tax would not raise sufficient revenue for the government to enable it to do away with all other taxes, and so the whole theory of the single tax would be upset. Says Mr. Spahr (*idem*):

As regards England, we have fortunately at hand the statistics prepared by Mr. Giffen in his paper before the Statistical Society in Dec., 1886, in which he was not considering the subject of the single tax, and is therefore not open to the charge of special pleading. The value of the farm lands of Great Britain in 1885 was \$8,400,000,000. The value of the houses was \$9,500,000,000. If we assume that 60 per cent of the value of the English houses was the value of the land on which they stood, then the total value of all the land in England was but \$14,000,000,000. The taxation of England in 1885 was \$750,000,000, of which not to exceed \$100,000,000 rests upon land. The question then is, Could the land of England support an additional tax of \$650,000,000? The answer is obvious when we remember that Mr. Giffen arrived at the total land value by multiplying rentals by thirty; that is, the average rental of land in England is 3 1/3 per cent. Three and one third per cent upon \$14,000,000,000 would be but \$470,000,000. In other words, the single tax in England, even if the entire rentals of the land inclusive of improvements incorporated within the soil were taken, would produce a deficit of \$200,000,000 annually.

In America the aggregate deficit is less clear. Yet here we find that in most of our Eastern states the local taxes alone have for years been much greater than the aggregate increase in the values of the land. For example, in Connecticut during the past fifteen years the assessed value of the land has increased \$36,000,000. The aggregate taxes paid have been more than \$70,000,000. As these taxes have been contributed by the property-owners, the latter have already more than paid for the increment which they have received. The logical application of the single-tax theory would require that

the property-owners receive back the taxes they have advanced, and turn over to the public the increment that has arisen. This would leave the public vastly in debt to the property-owners, instead of the property-owners vastly in debt to the public.

Fifthly, it is argued that the single tax rests on a complete misreading of present facts. Mr. Spahr continues in the above article:

The fundamental mistake of Mr. George and the single-tax advocates is their conception that in the value of the land the community has a vast element of wealth which has somehow come of itself, without the expenditure of labor or capital. A correlative error is their assumption that another amount equally vast may now be created without labor, by adopting their system. Their platform promises that the single tax would make it impossible for speculators and monopolists to hold opportunities unused or only half used, and would throw open to labor the illimitable field of employment which the earth offers to man. It would thus solve the labor problem, doing away with involuntary poverty, raise wages in all occupations, and cause such an enormous production of wealth as would give to all comfort, leisure, and participation in the advantages of an advancing civilization.

Here it is assumed that if the taxes now levied upon houses and improvements were repealed, there would at once be an immense addition to the national wealth. All the unimproved farm land would at once be brought under cultivation; all the vacant building lots would at once be covered with houses. This were indeed a consummation devoutly to be wished, but this is the most absurd portion of the entire single-tax program. Houses cannot be built except out of new savings, unless capital can be withdrawn from other enterprises. To withdraw capital from other enterprises where it is more remunerative, and put it into the building of houses which will not be needed by the community for years, or into the improving of farms whose cultivation is not yet demanded, would be the most enormous possible waste of our national wealth. There is no vast fund of wealth in the air which can be brought to earth by the touch of Mr. George's magic wand. The amount of wealth which society can produce is limited by the amount of labor and capital which society has at its disposal. Any plan to turn this investment out of its natural channel involves an economic loss. Except in trivial and exceptional cases, there is no wealth which is not the product of labor, and no wealth can be created except as the product of labor.

Lastly, conservatives argue that rent is not the enormous evil it is considered by land reformers, and that what evil it does do will not be removed by the single tax. Of the inability of the single tax to remove the evils of rent for the city poor, Professor Seligman says (*single-tax discussion before the American Social Science Association, Sept. 5, 1890*):

How is the single tax going to relieve the inhabitants of the slums? They will not go to the suburbs, where there is plenty of land, for the same reasons that they do not go there now. Rent in the suburbs or up-town districts is at the present moment vastly less than in the crowded slums, and yet the slums are crowded. The average workman prefers to be near his work, prefers to enjoy the social opportunities of contact with his fellow workman, evenings as well as daytimes. All careful students of the problem of housing the poor have come to the conclusion that it is in the crowded centers where there is no unoccupied land, and not in the suburbs where rents are low, that the problem must be solved. Now, when we look at the thing from a practical standpoint, how is the tenement-house workman to derive any benefit from the single tax? His rent will be just exactly as high as at present; for his rent is a veritable rack-rent, fixt by the stress of competition. The competition for rooms will be not a whit less when the State becomes the landlord. And how are his wages to be increased? Wages can be increased in only one of three ways—through the increase of capital, through the increased efficiency of the laborer, or through the increased standard of living, which will enable the workman to compel higher wages. But the single tax can accomplish none of these three things. To take away economic rent and to turn it over to the State, will not increase capital one whit, will not decrease the monthly rent of the tenement-house population by one iota. Into what does all this fair dream of economic felicity resolve itself? Into mere mist, into mere nothingness. The tenement-house population, no more than the American farmer, will derive no advantage from the single tax.

The Socialist objections to the single tax are different. They agree absolutely with the single-taxers, that the natural values of the soil should belong to no individual! They favor land

nationalization, and many of them believe that the single tax would be a good way to introduce such a measure, but they do not believe in the taxation of land values as a single tax, nor that by itself the single tax would do much good, nor even that it should be favored as a practical first step toward socialism. They favor only the increasing taxation of land values in connection with other reforms, as is being done

Socialist Objections

in Australia as a part of a Socialist program. They object to the single tax by itself or even as a first step, first, because by itself, or even by itself for a while, it would do little good. As Professor Seligman has shown above, it would not lower rent in the cities, but only transfer rent to the government. It might throw suburban land held for speculation on to the market; but only those could buy this land who had capital with which to improve it. Poor men could not get the land. But rich men could hire labor to improve it, and this would employ labor. Yes, but at what prices? Only by withdrawing capital from other investments and attracting laborers from other cities, which would mean a competition changing rather than raising wages. The attracted laborers, too, would have to live somewhere. They could not buy the land, nor live far from their work, hence they would crowd into the already overcrowded slums, and thus raise rents. Landlords could put up cheap tenement-houses, make profits from them, and still pay all the land values to the government.

A deeper Socialist objection is that the single tax, unaccompanied by socialism, would simply rivet the chains of the workingman. Single-taxers usually claim that if land values were taxed, land would be thrown open to all, all would have opportunity to labor and could secure the full return of their labor; the smart getting much, and the less able less, but each according to his deserts. This is not at all the case. Taxing land values would not throw land open to all, but only to those with capital, for, according to the theory, those offering most for the land would get it, and capitalists could offer most. Men are not equal in ability. Smart men with land would make better use of it than others. They could afford to buy machinery; other men could not. With that advantage they could undersell and eventually drive out the feebler folk, who would have to toil at wage labor as to-day.

The smart men could leave money to their children, and so children, even tho not smart themselves, could live in idleness, while others toiled for them as to-day. The single-taxers' glorification of competition plus a single tax calls for the competition of equals, to be just. In practise it would be the competition of unequals, which means the rule of smartness, shrewdness, and force, which is not just. Some argue that it is just that the strong should get the good of their strength and that the weak should suffer for their weakness. This possibly would be just, if men wholly made themselves, but men do not. They are largely modified by environment. The well-fed son of a capitalist can get land and live in idleness, hiring the sickly son of a sickly workingman to toil for him. Is this just?

Thirdly, Socialists deny any such distinction between land values and other values as the single tax claims. If individuals alone have not produced the land, they also have not alone produced other things. All production as well

as that of land values belongs to all. Says Professor Seligman (idem):

Individual labor, I venture to say, has never by itself produced anything in civilized society. Let us take the workman fashioning a chair. The wood he certainly has not produced. The tools that he uses are the result of the contribution of others. The house in which he works, the clothes he wears, the food he eats (all of which are necessary to the making of a chair in civilized society), are the result of contributions of the community. His safety from robbery and pillage—nay, his very existence—is dependent on the ceaseless cooperation of the society about him. How can it be said, in the face of all this, that his own individual labor wholly creates anything? If it be answered that it pays for his tools, his clothing, his protection, etc., I say, So does the landowner pay for the land he purchases. Nothing, I repeat, is wholly the result of unaided individual labor. No one has a right to say, This belongs completely and absolutely to me, because I alone have produced it. In truth, this is the groundwork of socialism. The Socialists have been far more logical than Henry George. They deny the existence of any difference, save that in degree, between property in land and property in other capital. That is the reason why the English enthusiasts are leaving land nationalization and enrolling themselves under the banners of socialism. That is the reason why, in this country, the growth of Bellamy's nationalism marks the gradual decadence of the single-tax movement. That is the reason why any one who has to do with laboring men throughout the country is now meeting in every center hundreds who were formerly Georgites, but who now have become converted to the newer forms of socialism.

SISMONDI, JEAN CHARLES LÉONARD SIMONDE DE: Historian; economist; born in Geneva, Switzerland, 1773. Educated in his native town, became a clerk in Lyons, but political disturbances drove him into exile and he lived in England and Italy for some years. Settled in Geneva in 1800, and devoted himself to literature, politics, and economics.

Wrote first a treatise, "*De la Richesse Commerciale*," in which he followed strictly the principles of Adam Smith. Afterward came to regard these principles as insufficient and requiring modification. Contributed articles on political economy to the "*Edinburgh Encyclopædia*," in which his new views were partially indicated. They were fully developed in his principal economic work, "*Nouveaux Principes d'Économie Politique, ou de la Richesse dans ses Rapports avec la Population*," and "*Études sur les Sciences Sociales*." Became, however, best known as a historian with his "*Histoire des Républiques Italiennes du Moyen Âge*," his "*Histoire des Français*," 31 vols., and lesser works. Died in Geneva, 1842.

SLAVERY: Slavery is the first condition in which laborers as a class appear in history. In the hunter period of our human history the conqueror does not enslave his vanquished foe, but slays him at once; in the pastoral period slaves are generally captured only to be sold; but when sedentary life begins, slavery originates. Especially where warlike habits prevail, slaves are procured to provide food for their military masters. Slavery was modified wherever theocratic organizations became established, and only reached its extreme form where the military order dominated the sacerdotal. Slavery was an advance on what went before. It was infinitely better than cannibalism, or the wholesale slaughter of the captives in war. It may be said here that slave was originally a national name; it meant a man of Slavonic race captured and made a bondman by the Germans. Its ultimate derivation is from *slava*, glory.

Wherever slavery has existed, it has meant wrong, injustice, violence, brutality, engendered both in master and slave. Prisoners of war, held

for debt, or self-sold—slaves have had little but cruel treatment until their emancipation by death.

Early Slavery

Hebrew slavery was milder than that of any other nation. The law protected the slave from violence and from permanent bondage. Every slave was to be emancipated at the seventh year. (See JUDAISM.) In Greece we find slavery fully established in the Homeric period. War captives are enslaved, sold, or held at ransom. Sometimes the women only are saved from slaughter. Pirates occasionally kidnaped free persons and sold them for slaves in other regions. Not unfrequently the slave would be of nobler birth than his owner. The men slaves were made to till the ground and tend the cattle, and the women slaves to perform the domestic duties.

It is, however, most interesting and important to study slavery as it appeared later in historic Greece, and especially at Athens. The sources of slavery in Greece were: (1) Birth, the enslavement of slaves' children. This was not a common source, as it was found cheaper to buy a slave than to rear one. (2) Sale of children by their free parents. (3) Through indigence freemen sometimes sold themselves; and at Athens, before Solon, an insolvent debtor became the slave of his creditor. (4) Capture in war. After Thebes was taken by Alexander, 30,000 women and children are said to have been sold. (5) Commerce. There was a systematic slave-trade. The principal slave-markets were Athens, Chios, Cyprus, Samos, and Ephesus. Thrace was the chief source of supply. Servile labor gradually displaced free labor, not only in agriculture but in manufactures and commerce as well. Speculators either directly employed slaves or hired them out for profit. Athenæus gives the number of Athenian slaves as 400,000; Hume, however, says it should be 40,000.

The condition of the slaves at Athens was not as bad as in many other countries. Privileges were allowed them which in Rome would have been termed license. Says Dr. Ingram:

The slave was introduced with certain customary rites into his position in the family; he was in practise, tho not by law, permitted to accumulate a private fund of his own; his marriage was also recognized by custom; tho in general excluded from sacred ceremonies and public sacrifices, slaves were admissible to religious associations of a private kind; there were some popular festivals in which they were allowed to participate; they had even special ones for themselves, both at Athens and in other Greek centers. Their remains were deposited in the family tomb of their master, who sometimes erected monuments in testimony of his affection and regret.

The Athenian law afforded some protection to the slave. He had an action for outrage, like a freeman; and if killed by a stranger was avenged as a citizen. If a master slew a slave, it was atoned for by exile and religious expiation. Even when the slave struck back and killed his master, he had to be handed over to the magistrate for punishment. There were several ways in which a slave might become a freeman: by buying his freedom, by having his name inscribed in the public registers, by sale or donation to certain temples, by proclamation in the theater, law court, or other public place, or by being freely emancipated by his master. The condition of the Helots of Laconia was peculiar. They were owned by the State, which gave their services to individuals. The domestic servants of Sparta were all Helots, who were gener-

ally serfs, living in country villages and cultivating the land of their masters. They had homes, wives, and families; could acquire property, and could not be sold out of the country. They were employed in public works, and also served as light-armed troops in war. They were never trusted by the Spartans, and on one occasion 2,000 Helots, who had distinguished themselves by their courage on the battlefield, were foully massacred.

But it was in Rome that slavery found its most natural and relatively legitimate state—Rome in its later rather than in its earlier days, when the farmer and his slave worked in the field side by side. But the growth of wealth through conquest created a demand for slave-labor, and separated the owners from the necessity to labor. Immense numbers of slaves were sold after every war. Cesar on one occasion in Gaul sold 63,000; and in Epirus 150,000 were sold by Paulus after his victory. By the Jewish war the Romans acquired 97,000 slaves, besides slaughtering thousands in the arena. The Roman writers speak of some masters who possess 400 slaves, and of one who owned as many as 4,116. Blair fixes the proportion of slaves to freemen as three to one in the Roman world. According to this calculation there would have been in Italy, in the reign of Claudius, 6,944,000 freemen and 20,832,000 slaves. The original Roman law allowed the master the power of life and death over his slaves; he was an absolute and irresponsible despot. The slave could not legally possess property, tho in practise he was often permitted to enjoy and even accumulate chance earnings. Slave marriage was tolerated without being made legal; and thus a slave was not deemed capable of the crime of adultery. By general sanction and custom, however, the marriage relation was strengthened, and the names of husband and wife were commonly used in reference to slaves. For committing any state offense they were punished with death. In law they could not be examined as witnesses, except by torture. An accused slave could not invoke the aid of the tribunes; nor could he accuse his master except on the gravest crimes.

As to their treatment, many Romans favored a certain familiarity and friendliness of intercourse with their bondmen, but not such as to diminish the profit derived from their labor. The wide extent of the rural estates rendered personal knowledge or oversight of the slaves difficult, and by degrees chains came to be used, worn day and night. Even in private houses the porter was chained near the door. The master had his domestic favorites, and sometimes the attachment was one of mutual affection. During the wars slaves showed in noted instances the most noble and devoted fidelity to their owners. The bondmen who were outside the household had, however, the greater freedom of action.

In the mines, where slaves were sent by speculators, men and women worked half naked, in chains, and goaded by the curse and lash of overseers. Cato advised the farm lords to get rid of their old oxen and old slaves, as well as of their sick ones. Sick slaves were commonly exposed on an island in the Tiber. In the arena slaves were exposed to every torture and indignity that the devilish invention of their conquerors could devise. To furnish an hour's amusement to the titled aristocrats and languid idlers of "society," they were torn and mangled into bloody shape-

Classic Period

lessness by wild beasts from Africa, and compelled to stab, hack, strangle, and disembowel each other. No one has fully written, or will ever write, their sufferings. Slaves are not historians, and those whose scanty and unsympathetic chronicles comprize our only information saw little in their system of bondage to deplore. As compared with Greece, Rome provided greater facilities of emancipation. "No Roman slave," says Blair, "needed to despair of becoming both a freeman and a citizen." It was often a pecuniary advantage to the master to liberate his slave; he obtained a payment which enabled him to purchase a substitute, and at the same time gained a client.

But it is not until the second century of the Christian era that we notice a marked change with respect to the institution of slavery, not only in sentiment but in law as well. The victory of moral ideas became apparent. Dio Chrysostom, the adviser of Trajan, is the first Greek writer who has pronounced the principle of slavery to be contrary to the law of nature. When Rome felt that industrial was soon to succeed military activity, it gradually prepared the way for the abolition of slavery by honoring the freedmen, by facilitating manumissions, and by protecting the slave from his master. Diocletian forbade a freeman to sell himself. Man-stealers were punished with death. The insolvent debtor was withdrawn from the power of the creditor. The atrocious mutilation of boys and young men was stopped. Hadrian abolished the underground prisons and took away from the masters the power of life and death. In the reign of Nero magistrates had been instructed to hear the complaint of an ill-treated slave. Marcus Aurelius brought the relations between master and slave more directly under the control of law and public opinion; and while a slave's oath could not be taken, he was allowed to speak.

While the Christian Church did not at once denounce slavery as a social crime; while it recognized the institution, and allowed ecclesiastics to own slaves, it created sentiments favorable to their humane treatment, and planted the seeds from which emancipation finally sprang. (See CHURCH AND SOCIAL REFORM.)

Gradually the slave came to be regarded as merely a servant tied to the soil, i. e., a serf. (See FEUDALISM.) The early forms of serfdom differed little from mild slavery, but by degrees improved, till at last serfdom itself disappeared. Yet, soon after this, the new system of colonial slavery appears, which was no necessary stage of human development, but a monstrous moral, political, and social aberration, which resulted in nothing but evil. In 1442 the Portuguese began to trade in slaves, fitting out a number of ships, and building forts on the African coast. After the discovery of America, Columbus proposed an exchange of his Carib prisoners for live stock. He urged that by this exchange infidels would be converted, the royal treasury enriched by a duty on Caribs, and the colonists supplied with live stock free of expense. In 1494 he sent home 500 Indian prisoners; but Isabella humanely ordered them to be sent back. The Bishop of Chiapa, to protect the Indians from cruelty, advised the importation of negro slaves into the Spanish colonies, and his advice was unfortunately adopted. Some Genoese merchants bought the right of supplying America with negroes, and thus began that odious commerce be-

tween Africa and America, which increased to such an amazing extent.

Captain John Hawkins was the first Englishman who engaged in the hateful traffic, tho for a long time the English traders supplied only the Spanish settlements with slaves. In 1620 slavery began in Jamestown, Va., among the tobacco planters. It increased rapidly until, in 1790, the State of Virginia alone contained 200,000 negroes. For a long time the British slave-trade was in the hands of exclusive companies, but by an act of the first year of William and Mary it became free and open to all. Between 1680 and 1700 about 140,000 negroes were exported by the African Company, and 160,000 more by private adventurers. The total import, from 1680 to 1786, into all British colonies in America, has been estimated at 2,130,000. Shortly before the War of Independence the British slave-trade reached its utmost extension, the number of slave-ships being at least 192. During the war the trade decreased, but revived at its termination. More than half the trade was at this time in British hands. The demand for slaves by European colonies reduced the tribes of the African seacoast to a pitiable condition. All that was shocking in the barbarism of the savage was multiplied and intensified by the horrors of the traffic. There was the utmost recklessness of human life, and indifference to misery and torture. The mode of capturing slaves killed its thousands; and the middle passage its tens of thousands.

Exclusive of the slaves who died before they sailed from Africa, 12½ per cent were lost during their passage to the West Indies; at Jamaica 4½ per cent died while in the harbors or before the sale, and one third more in the "seasoning." Thus, out of every lot of 100 shipped from Africa, 17 died in about nine weeks, and not more than 50 lived to be effective laborers in the islands. The circumstances of their subsequent life on the plantations were not favorable to the increase of their numbers. In Jamaica there were, in 1690, 40,000; from that year till 1820 there were imported 800,000; yet at the latter date there were only 340,000 in the island.

But when, in the latter part of the seventeenth century, the nature of the slave-trade began to be understood, all that was best in Great Britain was shocked at its atrocities.

The honor of taking the first practical action against slavery belongs to the Quakers, and especially to their founder—George Fox.

In 1727 they declared it to be "not a commendable or allowed" practise; in 1761 they excluded from their society all who should be found concerned in it, and issued appeals to their members and the public against the system. In 1783 there was formed among them an association "for the relief and liberation of the negro slaves in the West Indies, and for the discouragement of the slave-trade on the coast of Africa." This was the first society established in England for the purpose. The Quakers in America had taken action on the subject still earlier than those in England. (For America, see ABOLITIONISTS.)

In 1787 a committee for the abolition of the slave-trade was formed, with Granville Sharp as president, and after twenty years of persistent labor it met with complete success. On March 25, 1807, a bill was passed which enacted that no vessel should depart for slaves from any port

within the British dominions after May 1, 1807; and that no slaves should be landed in the colonies after March 1, 1808.

As to France, the abolition of its slave-trade was preceded by stormy struggles and deplorable excesses. The French law was, with regard to the treatment of slaves, humane in its general spirit, but was habitually disregarded by the planters. In 1788 a society was formed in Paris under the presidency of Condorcet, which aimed to suppress slavery itself. The motive and impulse of this movement were not avowedly Christian, as in England; but its cause was rather the enthusiasm for humanity which pervaded France during the revolutionary period. In spite of the "Declaration of the Rights of Man" in Aug., 1789, the French system of negro slavery continued. St. Domingo or Hayti was the chief French colony employing slaves. In 1791 there were 480,000 blacks, 24,000 mulattoes, and only 30,000 whites. In August of this year a rebellion of the negroes broke out, marked by brutal excesses on both sides. For years it raged with varying success, until in 1798 the negroes, under Toussaint l'Ouverture, secured entire possession of the government. This African liberator has been called the noblest type ever produced by the negro race. Slavery was abolished, and the whole population began to rise in civilization and comfort. In 1825 the independence of the island was formally recognized by France; and thus the negro race obtained its first independent settlement outside of Africa.

To Denmark belongs the honor of first abolishing the slave-trade, which it did by a royal prohibition on May 16, 1792. In 1794 the United States first forbade American citizens to participate in the foreign trade in slaves; and in 1808 an act came into force which prohibited the importation of slaves. It was provided at the Vienna Congress that the trade should be abolished as soon as possible. As soon as the English slave-trade was stopt, several circumstances combined to greatly increase the traffic and aggravate its evils.

In consequence of the activity of the British cruisers the traders made great efforts to carry as many slaves as possible in every voyage, and practised atrocities to get rid of the slaves when capture was imminent. It was, besides, the interest of the cruisers, who shared the price of the captured slave-ship, rather to allow the slaves to be taken on board than to prevent their being shipped at all. Thrice as great a number of negroes as before, it was said, was exported from Africa, and two thirds of these were murdered on the high seas. It was found also that the abolition of the British slave-trade did not lead to an improved treatment of the negroes in the West Indies. The slaves were overworked now that fresh supplies were stopt, and their numbers rapidly decreased.

It became increasingly evident that the evil could be prevented only by total prohibition of the whole traffic. The conscience of the nations began to awaken; and the lawfulness of slavery became a matter of discussion. Buxton, in response to an appeal from Wilberforce, moved, in 1823, that the House should consider the state of slavery in British colonies. His project was one of gradual abolition, by introducing a kind of serfdom, and freeing the children of the slaves. Altho the struggle was continued by many noble

and able men, it made little progress until 1828, when free negroes were placed on a footing of legal equality with the whites. Two years later the British public aroused itself at last; and in 1833 Earl Grey carried a motion through the House for complete abolition. This received the royal assent Aug. 28th. A sum of \$100,000,000 was voted as compensation to the planters; and a system of apprenticeship for seven years established as a transitional preparation for liberty. All children under six years of age were to be at once free, and provision made for their instruction. Immediate liberation was carried out in Antigua, and public tranquillity was never so unbroken as during the following year. This led to the shortening of the transition period in the other colonies, and gave freedom to all the slaves in Aug., 1838.

The other European states one by one followed this example; France in 1848, and the Dutch in 1863. After this last date there still remained three countries in which the slave system was undisturbed—Brazil, Cuba, and the U. S. The fathers of the American states were by no means defenders of slavery. Washington provided in his will for the emancipation of his slaves, and said to Jefferson that it was among his first wishes to see some plan adopted by which slavery in his country might be abolished by law. John Adams declared his abhorrence of the system; while Franklin, Madison, Hamilton, and Patrick Henry reprobated the principle of it. Jefferson declared that in the presence of the institution he trembled for his country, when he remembered that God was just. In the Constitution, which was drawn up at Philadelphia, 1787, the sentiments of the framers were against slavery; but through the insistence of Georgia and South Carolina, it was recognized. The words "slave" and "slavery," tho, were excluded from the Constitution, because, as Madison explained, they did not choose to admit the right of property in man, in direct terms. Soon after the union was formed the Northern states, beginning with Vermont, either abolished slavery or adopted measures that led to abolition; but this simply transferred the slaves to the markets of the South. Step by step the slave power for a long time increased in influence.

The acquisition of Louisiana—including the state so named, Arkansas, Missouri, and Kansas—(1803), tho not made in its interest; the Missouri compromise (1820), the annexation of Texas (1845), the Fugitive Slave Law (1850), the Kansas-Nebraska Bill (1854), the Dred Scott decision (1856), the attempts to acquire Cuba (1854) and to reopen the foreign slave-trade (1859-60), were the principal steps—only some of them successful—in its career of aggression. They roused a determined spirit of opposition, founded on deep-seated convictions. The pioneer of the more recent abolitionist movement was Benjamin Lundy. He was followed by William Lloyd Garrison, Elijah P. Lovejoy, Wendell Phillips, Charles Sumner, John Brown, all of whom were in their several ways leading apostles or promoters of the cause. The best intellect of America outside the region of practical politics has been on the antislavery side. William E. Channing, R. W. Emerson, the poets Bryant, Longfellow, preeminently Whittier, and more recently Whitman, have spoken on this theme with no uncertain sound. The South, and its partizans in the North, made desperate efforts to prevent the free expression of opinion respecting the institution, and even the Christian churches in the slave states used their influence

Abolition

in favor of the maintenance of slavery. But in spite of every such effort opinion steadily grew. (See ABOLITIONISTS.)

Mrs. Harriet Beecher Stowe (*q. v.*), in her "Uncle Tom's Cabin," deeply stirred the public sentiment of the North against slavery. Finally, it became evident that the question could not be settled without an armed conflict. When Abraham Lincoln was made president in Nov., 1860, this was the signal for the rising of the South. While the North took up arms at first simply to maintain the union, it was soon recognized that the real issue of the conflict was the life or death of the slave system. In 1862 the slave system of the territories was abolished by Congress; three years later the war closed; and on Jan. 1, 1863, Lincoln issued his proclamation of freedom. A constitutional amendment was passed in 1865 abolishing and forever prohibiting slavery throughout the U. S.

In Brazil there were, in 1835, 2,100,000 slaves. In 1880 Joachim Nabuco, the leader of the anti-slavery movement, introduced a bill for the more rapid liberation of slaves, and for the final extinction of slavery in Brazil by Jan. 1, 1890. This plan was carried into effect.

In Russia the original rural population consisted of slaves, free agricultural laborers, and peasants proper. Czar Paul (1796-1801) commanded that serfs should work for their masters only three days a week; but no decisive measures were taken until the reign of Alexander II. (1858). That emperor set a plan in motion which resulted in the abolition of serfdom in March, 1861. (See RUSSIA.)

Slavery, as it exists in the Mohammedan East, is not of the field, but of the household. Slaves are treated as members of the family, with tenderness and affection. The Koran teaches kindness and sympathy, and encourages manumissions. But, standing behind this comparatively mild and humane bondage, is the slave-trade with all its cruelties. Turkey has frequently declared slavery to be illegal, but has been too lax and nerveless to enforce its declarations.

Modern Times

The principal centers from which slaves are now furnished to Egypt, Persia, Turkey, and Arabia are three in number: (1) The Sudan, south of the Great Desert, seems to be yet a vast hunting-ground; 10,000 annually are marched to Fezzan, enduring unimaginable sufferings. The desert highways are white with their bones. The total number of slaves in Morocco is about 50,000. (2) The basin of the Nile, extending toward the great lakes. Sir Samuel Baker and Colonel Gordon checked the traffic here for a while, but since the Sudan revolt slave-capturing has flourished almost unmolested. (3) The Portuguese possessions on the East African coast. The Portuguese appear to be the most determined upholders of the system, and are intensely hated by the natives. In 1880 it was estimated that about 3,000 slaves were exported annually from this region.

Both Clarkson and Buxton realized that the only effectual preventive of slavery would be the establishment in Africa of legitimate commerce. It was hoped that Sierra Leone and Liberia would serve this purpose; but they have not been successes in that line. In Sept., 1876, King Leopold of Belgium called a conference of geographers to consider the question of the ex-

ploration and civilization of Africa by means of commerce, and the abolition of the slave-trade. An International African Association was formed, six European nations being represented. Various expeditions have been made through the inland districts, the most notable being that of Stanley along the Kongo. The Kongo Free State was formed. In 1884 an international conference held at Berlin declared that "these regions shall not be used as markets or routes of transit for the trade in slaves, no matter of what race; we bind ourselves to put an end to this trade and punish those engaged in it." The population of the Kongo Free State is estimated at 42,608,000.

At first the new enterprise was conducted along humane and benevolent lines; but about 1903 several investigators reported that the most atrocious cruelties were being practised upon the natives. A strong indictment of the Belgian Government was made. The King of Belgium has denied that these cruelties exist, but no evidence has been given which offsets that of the investigators. The mutilation of the Kongo natives is at present one of the scandals of the world, for which no excuse can be made. (See KONGO QUESTION.)

In 1890 a general act was agreed upon by all parties (including Turkey, Persia, Kongo Free State, and Zanzibar, with the U. S. and all the greater European powers) on the following program:

(1) A civilized protectorate over the administration of the African territories.

(2) The establishment of strong stations by each power in its own territory to repress slave-hunting.

(3, 4, 5) The development of Central Africa by roads, railways, steamboats, with fortified posts and telegraphs.

(6) The organization of expeditions and flying columns to protect them and support repressive action.

(7) The restriction of the importation of modern firearms and ammunition through the slave-trade territory.

On the Indian Ocean and along Madagascar the powers also agreed to put down slave-trading in small vessels.

H. N. CASSON.

REFERENCE: *A History of Slavery and Serfdom* (1895), by J. K. Ingram, an expansion of his article in the *Encyclopedia Britannica* on which this article is mainly based.

SLIDING SCALE: Wages are said to be on a "sliding scale" when an agreement is made between an employer and employees that the wages shall rise and fall with selling prices in the trade concerned. This form of wage agreement has been considerably favored by some of the older and stronger trade-unions of England and America, particularly in the mining and iron and steel trades. It was long ago adopted by the Amalgamated Association of Iron and Steel Workers (*q. v.*), and has often prevented wage disputes. It has not, however, proved itself perfectly satisfactory, because there is nothing to prevent prices going so low as to carry wages below the living point. Hence the agitation for the "minimum wage" (*q. v.*). (See also ARBITRATION.)

SLUMS: A name loosely given to crowded, squalid quarters, or dirty back streets or alleys, occupied by the poor and wretched, and often by

criminals or semicriminals. There is no clear dividing line, however, between slums and poor tenements. (For statistics, see articles TENEMENTS and OVERCROWDING.) We give here a few representative quotations from informed social students and workers. Referring to what is known in New York City as the "lung block," because of its numerous cases of consumption—a block bounded by Cherry, Catharine, Hamilton, and Market Streets, yet sufficiently near the East River and an open area to have their fresh air—Ernest Poole says, in "A Handbook on the Prevention of Tuberculosis" (1903):

For a month I went through it with health and tenement inspectors, as a settlement visitor one week, as a "fresh-air man" the next. I used this one block as a center, not to prove but to image what has already been proved all through the civilized world, to image the three great evils we must fight in the tenements. These evils are congestion, dissipation, infection.

That the plague spreads with congestion has long been proved beyond the shadow of a doubt. It spreads even faster than the crowd pours in. So it is in the block we have taken. It stands in one of the most congested wards of the most crowded city in the world, and this Seventh Ward is steadily, swiftly packing closer. Between 1890 and 1900 the density of its already crowded population increased no less than 65 per cent. Now it holds 478 humans to an acre. The lung block alone holds nearly 4,000, not to mention dogs, cats, parrots, and one weakened old monkey. Of the humans some 400 are babies.

It is a block packed close with huge, grimy tenements; these tenements are honeycombed with rooms; these rooms are homes for people. To squeeze in more homes light and air are slowly shut out. Halls, courts, air-shafts, are all left cramped and deep and sunless.

It is a block of a thousand homes. Through halls, in rooms, on stairways, in courts, in shafts, and out on fire-escapes are sprinkled the 400 babies. At the age of two they are found alone in the street, already imbibing its deep, muddy wisdom. So this muddy street overflows into the home. It is hard for the home to keep wholesome and pure. Things and people—good and bad—have only partitions between them.

In a block so congested the plague spreads swiftly. In the past nine years alone this block has reported 265 cases. From doctors, druggists, and all others who know, I gathered that this is but half the true number.

In a block so congested dissipation comes easy. Foul air, darkness, wretched surroundings—these work on the home by day and by night. Here a thousand homes struggle on, while hundreds yield and sink, and so pollute the others. So come squalid homes and wretched meals. So come the humorous, shattered old chap who told me, "I ain't never sober but whin I gits out of bed." So come hundreds of others, men and women, young and old; drunk, bestial, vile, forever steadily sinking. Hard drinking triples susceptibility to consumption. This is seen most of all in the Irish; hence among the Irish the death-rate from the plague is twice that of any other white nationality. The Jews, with their strict habits, their dietary laws, and a certain standard of cleanliness enforced by a rigid religion, show the lowest death-rate of all, tho this is rising as they become tenementized. At present the lung block has only Jews on the Market Street end, and among them we found hardly a case of consumption. The body of the block is packed with Irish and Italians, and a sprinkling of two other peoples. All these image best the dissipation, the shattered vitality which eats into savings, starves the home, then gives the plague easy entrance, and makes it a constant danger to all in the family.

Says Dr. Josiah Strong ("The Challenge of the City," 1907), and basing his statements mainly on the reports of the New York State Tenement-House Commission and "The Tenement-House Problem" (R. W. De Forest and L. Veitler, 1903):

According to the report of the New York State Tenement-House Commission 2,372,079 persons, or two thirds of the city's population, were then living in New York's 82,652 tenement-houses. This is a larger population than can be found in any one of thirty-six of our great states.

Every one of these tenement dwellers is living in an environment more or less unfavorable to a normal life. In these tenement-houses have been found 350,000 dark interior rooms. These rooms depend for light and ventilation on connecting outer rooms or on air-shafts. The so-called "air-shaft" is really a well of stagnant, foul air, about 28 inches wide, 50 or 60 feet long, and extending from the ground to the top of the building, often 60 or 70 feet or more. "The tenants often use the air-shaft as a receptacle for garbage and

all sorts of refuse and indescribable filth thrown out of the windows, and this mass of filth is often allowed to remain, rotting at the bottom of the shaft for weeks without being cleaned out." So vile are the resulting odors that many of the fifty or sixty windows opening into the shaft must often be closed and sometimes they are permanently nailed up.

A majority of the hallways are pitch dark, and any one entering from the street must grope his way along the wall as best he can and stumble up the stairs. In these hallways are common sinks and closets, which are sure to become filthy, as no one can see the dirt. Moreover, where there are many to contribute to the dirt, any one disposed to be cleanly soon thinks it is useless to try.

In the ten-foot yard behind the "double-deckers," as we are told by an inspector, "there is a perfect rain of refuse from the windows of the ten or fourteen apartments above," while "many cellars have the floor covered with dirt and rubbish from a small layer upward to 2½ feet, besides sweepings, ashes, and rubbish in heaps."

"They are centers of disease, poverty, vice, and crime. All the conditions which surround childhood, youth, and womanhood in New York's crowded tenement quarters make for unrighteousness. . . . The most terrible of all . . . is the indiscriminate herding of all kinds of people in close contact, the fact that, mingled with the drunken, the dissolute, the improvident, the diseased, dwell the great mass of the respectable working men of the city with their families." There is little wonder that when the Buffalo members of the New York State Commission of 1900 examined into tenement-house conditions in New York after "several days of silent amazement," they exclaimed: "New York should be abolished."

A friend of the writer, a few years ago, went with a city missionary on a midnight tour of exploration, which he thus describes: "A few steps out of Broadway we came to the vilest dens of infamy. In one room, not more than 10 by 12, we came upon eighteen human beings, men and women, black and white, American and foreign-born, who there ate, slept, and lived. In that room we found a woman of the highest refinement and culture with a faded dress of a courtesan upon her dishonored body; a former leader in the Salvation Army, a woman of sweet song, half drunk; a snoring, disgusting negro wench; an opium-eating, licentious Italian, etc. Out of that den had been rescued a descendant of one of the most illustrious men this country ever produced; and there had been found a daughter of a Brooklyn clergyman who had no knowledge of her whereabouts."

The evils of modern city life are by no means confined to American cities. (See HOUSING IN GREAT BRITAIN, NEED OF.)

Says Professor Huxley ("Social Diseases and Worse Remedies"):

"Any one who is acquainted with the state of the population of all great industrial centers, whether in this or other countries, is aware that, amid a large and increasing body of that population, *la misère* reigns supreme. . . . I have no pretensions to the character of a philanthropist, and I have a special horror of all sorts of sentimental rhetoric; I am merely trying to deal with facts, to some extent within my own knowledge, and further evidenced by abundant testimony, as a naturalist; and I take it to be a mere plain truth that throughout industrial Europe there is not a single large manufacturing city which is free from a vast mass of people whose condition is exactly that described, and from a still greater mass who, living just on the edge of the social swamp, are liable to be precipitated into it by any lack of demand for their produce. And, with every addition to the population, the multitude already sunk in the pit and the number of the host sliding toward it continually increase."

What Professor Huxley means by *la misère* is apparent when he says (idem): "It is a condition in which the food, warmth, and clothing which are necessary for the mere maintenance of the functions of the body in their normal state cannot be obtained; in which men, women, and children are forced to crowd into dens wherein decency is abolished and the most ordinary conditions of healthful existence are impossible of attainment; in which the pleasures within reach are reduced to bestiality and drunkenness; in which the pains accumulate at compound interest, in the shape of starvation, disease, stunted development, and moral degradation; in which the prospect of even steady and honest industry is a life of unsuccessful battling with hunger, rounded by a pauper's grave."

Concerning moral conditions in the tenements, the Rev. J. O. S. Huntington (long resident on the East Side of New York) says:

At all seasons of the year the inhabitants of a tenement-house must meet one another in the entries (sometimes less than 3 feet wide), on the stairs, at the sink (there is but one on each floor); must see into one another's rooms as each person goes in and out; must use the roof, the doorway, the yard in common. But when the summer heats are on, and men

and women crowd together on the top of the house waiting for a breeze to come; when men will sit all night on a seat in the park to escape the closeness of a room where fire has been burning all day (not for cooking, but to heat the irons for the laundry or the tailor's shop); when every window must stand open to let in what little air there is; then it may be seen that privacy in a tenement-house is not much more possible than in an Eastern caravansary or in the steerage of an emigrant vessel. At such a time every loud word spoken reaches the ears of scores of people. From one room come the harsh tones of a husband and wife in the heat of a "family quarrel," oaths and imprecations ringing out on the fetid air; from another window come the shouts and frantic laughter of men and women (God pity them!) trying to drown their misery in liquor from the gin-mill on the corner; while from the roof of a neighboring house come the words of a ribald song flung out shamelessly to all within hearing, whether they choose or not. And, as if this were not debasing enough, in many of these blocks every other house has, on the ground floor, a saloon or rumshop, from which the smell of alcohol issues at all times; where the monotonous click of balls on the pool-table sounds till after midnight, when it gives place to the howls of drunken men turned out on the street; and past the door of which, often open into the entry, every person, every child in the house must pass to and from his room.

But this by no means exhausts the abominations of the system of tenement-house life. There is many a "home" where a boy or girl over fourteen years old would not think of passing an evening unless compelled to do so. Think of coming back after a hard day's work in a shop to find the only sitting-room half filled with wash-tubs, the baby crying, children squabbling on the floor, or perhaps tumbling about on the bed; the walls hung with the soiled clothes and dresses of the family; the whole place reeking with the smell of fat and garlic from the hot stove; the table "set" with coarse, broken china, strewn on a dirty board; a kerosene lamp, without a shade, smoking in the middle; a loaf of bread in the brown paper in which it was wrapped at the bakery, and a coffee-pot of black, bitter coffee. That is the scene which welcomes many a girl or boy, just beginning to realize how differently other people live. Is it strange that they gulp down their sugarless coffee, and at the first chance, slip out into the street beneath?

I am quite aware that much of what I have written will seem overstated. It seems so to me, and yet I know that it is not. Every single fact has been verified and can be verified in thousands of cases. And this is not more than half the truth . . . of the horrors of a state of things where manhood is brutalized, womanhood dishonored, childhood poisoned at its very source.

SMALL, ALBION WOODBURY: Professor of sociology and head of department at the University of Chicago; born 1854 at Buckfield, Me. Educated in public schools and at Colby University, 1876; Newton Theological Seminary, 1879; studied two years at the universities of Berlin and Leipsic; and was appointed professor of history and political economy at Colby University, 1881-88. For one year he was reader in history at Johns Hopkins University, and received the degree of Ph.D., whereupon he was elected president of Colby University, 1889-92. In the latter year he was appointed to his present position by President Harper, and has been editor of *The American Journal of Sociology* since its foundation. Author: "General Sociology," 1905. Address: University of Chicago, Chicago, Ill.

SMITH, ADAM: Political economist; born in Kirkcaldy, 1723; son of Adam Smith, controller of the customs. Studying in the local school he showed a great fondness for books. In 1737 he went to Glasgow University where he attended the lectures of Dr. Hutcheson; in 1740 he went to Balliol College, Oxford, with a view to taking orders in the English Church. Returning to Kirkcaldy for two years, he went to Edinburgh in 1748 and lectured on belles-lettres under the patronage of Lord Kames. There he won the friendship of David Hume; in 1851 he became professor of logic at Glasgow; in 1852 professor of moral philosophy. His first work as an author were two articles in 1755 in the *Edinburgh Review*. In 1759 appeared his "Theory of Moral Sentiments"; in 1762 he was made doctor of laws; in 1763 he took charge of the young Duke of Buccleuch on his travels.

He spent nearly two years in south France, and in a short time passed in Paris met the brilliant writers there. In 1766 he returned to England, and for ten years lived at Kirkcaldy with his mother, working on his great work, "An Inquiry into the Nature and Causes of the Wealth of Nations," which appeared in 1776. The next two years were spent in London in literary society, but in 1778 he was appointed one of the commissioners of customs in Scotland, and fixt his residence in Edinburgh; in 1787 he was elected lord rector of the University of Glasgow, but his health gradually failing, he died, after a painful illness, in 1790.

SMITH, CHARLES SPRAGUE: Director of The People's Institute, New York City; born Andover, Mass., 1853; graduated Amherst College, 1874; studied in Europe till 1880; 1880-91 professor of modern languages and foreign literature, and was organizer of Modern Language Department in Columbia University. Public lecturer from 1887; in 1896 organized the Comparative Literature Society, and in 1897 founded the People's Institute; member of various civic committees. He believes the time has come for community (municipality, State) to enlarge its control over public-service utilities and all fields of activity where monopoly can establish itself. He is not opposed to socialism—but favors rather the experimental advance toward socialization—without attempting to judge beforehand how far it will be necessary to go in order to safeguard the communal interests. Author of "Barbizon Days"; "Working with the People." Address: 318 East Fifteenth Street, New York City.

SNOWDEN, PHILIP: Member British Parliament of Independent Labor Party for Blackburn; born 1864 at Cowling, Yorkshire. He entered the Inland Revenue Department of the Civil Service in 1886; was maimed for life by a bicycle accident, and had to leave. During his convalescence he took up socialistic literature, and became a vigorous adherent of the Independent Labor Party. He was elected four times to the Cowling Parish Council, also three times on the Keighley Town Council and School Board. In 1898 he became a member of the National Administrative Council of the Independent Labor Party, and chairman of the party in 1900, and has since addressed meetings all over England. He is a good speaker, and a clear and logical writer. He stood twice for Parliament, and was elected in 1906. Address: 75 Spencer Place, Leeds, England.

SOCIAL CONTRACT: According to J. J. Rousseau (*q. v.*), a State is founded by a "social contract" between its members, whereby they, tho formerly living in a "state of nature" without laws, agree for their mutual good to form themselves into a social body and obey its constituted laws. His theory is a development of the teachings of Hobbes, Locke, and early thinkers, and is therefore best discussed in connection with other views. (See articles NATURAL RIGHTS; POLITICAL SCIENCE; ROUSSEAU; STATE.)

SOCIAL-DEMOCRATIC FEDERATION, THE (English), was founded in London in 1881, under the name of the Democratic Federation, and through the efforts of H. M. Hyndman, Herbert Burrows, Miss Helen Taylor (stepdaughter of

J. S. Mill), and others. In 1884 it became an avowed Socialist body and took its present name. It entered at once upon strenuous agitation, and was prominent in the agitation of 1886, with the so-called Trafalgar Square demonstrations, etc. To-day it has small but energetic branches in all the prominent English cities and centers of trade. William Morris, and a few others at first connected with it, left it, however, in 1885, to form a Socialist League, on the lines of a more communal and less parliamentary conception of socialism. John Burns, Tom Mann, and others also left it because of the policy of the federation in antagonizing all trade-union and political agitation not avowedly connected with and politically supporting Marxist socialism. The federation has thus become the one organization in England standing distinctly for Marxist socialism. Its leading spirit from the first has been H. M. Hyndman. Its organ is *Justice*, long under the editorship of Henry Quelch, and published at 37a Clerkenwell Green, E. C., London. It has of late years nominated many political candidates, but has polled but a small vote, since it stands largely aloof from other labor parties.

It has, however, to-day 194 sections with three in South Africa. It polled, in 1906, 29,810 votes and elected one candidate to Parliament, Will Thorne, in Southwest Ham, London. In 1907 it elected another, Victor Greyson, at a by-election.

In 1905 the Federation ran fifty-six candidates for municipal offices, polled 27,000 votes, and won ten new seats. At twenty-five other local elections since then 9,663 votes were polled and nine seats gained. This brought the total of members of local authorities up to over 100, in addition to ten elected borough auditors. The 1906 elections left matters much as before.

The Twenty-sixth Annual Conference was held at Bradford, eighty-five delegates representing seventy-six branches. The discussion of the question of rejoining the Labor Representation Committee resulted in a resolution, carried by fifty-two to eighteen, that while cordially sympathizing with the Labor Party and its independent action, affiliation was only possible so soon as the committee accepted a definite Socialist program. General secretary, H. W. Lee, 21a Maiden Lane, Strand, W. C.

SOCIAL EDUCATION ASSOCIATION, THE:

Organized as a result of a social education congress held at Boston, Mass. Its objects are to emphasize the fact that the fundamental purpose of education should be to prepare the child for a useful life of social service as an active and creative member of the social organism.

To enlist every good social agency in the work of educating all boys and girls—physically, mentally, industrially, and morally—to be of the highest use to themselves and to society.

To bring parents, teachers, and other citizens together in an intelligent effort to improve public schooling, and to adapt it to the complex needs of modern life.

To persuade the public to support, financially and morally, the highest and most modern type of school.

To publish the proceedings of the congress, to promote other such assemblies, and to serve as a "clearing-house" for the many agencies now working separately toward the above-named general ends. Secretary, Dr. Colin A. Scott, 103 Gainsborough Street, Boston, Mass.

SOCIAL INSTITUTES of considerably varying kinds but of one general character are springing up in all the larger cities, the common aim of which may be said to act as exchanges or clearing-houses for sociological or, more strictly, for social reform information. The more important of these we consider in special articles, but at least name them here. The *Musée Social* (5 Rue las Cases, Paris) was the first (1889) and began as a permanent continuation of the sociological exhibit of the Paris Exposition. The American Institute of Social Service (231 West Thirty-ninth Street, New York City) was organized under that name in 1902. The Milan *Umanitaria* (9 Via Alessandro Manzoni) which, tho acting as a center of information has also a large endowment for varied actual operations, commenced work about 1903. Rome has also a Social Institute. The Belgian Solvay Institute (1901) is more of a sociological college for special investigation. The International Labor Bureau at Basel (1901) is strictly international, but limited to the field of comparative labor legislation. (For all these, see special articles.) The British Institute of Social Service (11 Southampton Row, London) was organized in 1904, somewhat after the form of the American Institute, and now publishes a valuable monthly, *Social Progress*. A somewhat similar Swedish Central Alliance for Social Work (6 Lastmakaregatan, Stockholm) was begun in 1903. In Denmark a Social Bureau of Information was begun in Copenhagen in 1898. In Holland a Central Bureau for Social Advice (37 Vossiusstraat) was founded at Amsterdam in 1900. Germany has various social institutes of this general nature, a Central Bureau of Social Welfare at Berlin (14 Dessauer Str.), an Institute for Social Welfare at Frankfurt-on-the-Main, with an important branch in Berlin (30 Nollendorf Str.), besides social museums (*q. v.*) at Charlottenburg, Munich, Frankfurt, Bremen, and smaller institutes elsewhere. In Vienna the important Imperial Museum for Handicrafts and Crafts (founded in 1882), and in Moscow the Imperial Russian Technical Society (1897), largely fill this need. Hungary has a small social museum at Budapest (1901). There are the beginnings of such institutes in Japan, Australia, and elsewhere.

SOCIAL PURITY: Perhaps no movement devoted to the betterment and uplift of humanity has advanced more rapidly within recent years than that known as the Social Purity movement. During the past decade especially there has been an unprecedented growth, both in sentiment favorable to the movement and in the number and strength of the organizations promoting the cause for which it stands. European countries have suffered more from impurity and unjust regulation than other civilized peoples, and here the work has reached its greatest activity, with the United States a close follower; while most successful organized efforts are being put forth in South Africa, New Zealand, Australia, Canada, Mexico, and many of the more largely populated centers of South America and the Orient. The movement everywhere, when wisely guided, has the support of the most influential men and women prominent in reform, philanthropic and religious work, and in the medical and legal professions.

The purpose of this movement may be well un-

derstood and is clearly exprest in words taken from the "Object" of one of the well-known purity associations of the U. S., which are as follows:

The object of this association shall be to promote the cause of purity, by elevating public opinion as regards the nature and claims of morality; advocating a single standard of morals and the better protection and rearing of our young; aiding to foster and build up a more thorough rescue and reform work, and bringing weight and proper influence to bear upon our legislators and those in authority in securing more just laws; the repeal of bad ones, and the strict enforcement of all statutes pertaining to better morals.

It will thus be seen that the real purpose is to promote purity in the life of the individual and in social relations through preventive, educational, reformatory, rescue, law enforcement, legislative, and sanitary lines of effort, and while these divisions may not be advanced as of equal importance by every purity organization, they are recognized by all as the legitimate and necessary lines of activity. Methods differ somewhat, but in general all societies carry on the work by means of periodicals and other printed matter, including books, pamphlets, and tracts; lectures, public meetings, personal workers, conferences, and national and international congresses.

As a result, altho the movement is yet in its pioneer days, a purity literature has been created which will forever fortify against a return to the dense ignorance and prudery which existed on matters of sex and life a few years back. State regulation of vice has been banished from many cities and countries, and has never been permitted to gain a permanent foothold in the U. S. The white slave traffic, whereby girls are trapped and sold into vice, is being so thoroughly investigated and vigorously prosecuted both in Europe and America, that this trade will soon be overthrown. Age of consent laws are being wisely and justly rewritten to protect a girl's virtue until she reaches her majority as completely as they have heretofore defended her property. Necessary information pertaining to venereal infection and the leprosy diseases of vice is being disseminated. The single standard of morals is upheld as never before, and shelter extended to the "fallen" girl. Law and order leagues are carrying on a simultaneous crusade in many cities for the purification of morals and enforcement of law against the purveyors of vice. Editors of leading religious and literary journals are giving space to purity truths. But the one result of the purity movement which stands out and above all others, is the decided change in and present high state of public sentiment which makes the work itself possible.

In England and the Continent there are two very strong and representative organizations, with numerous others of national or sectional importance. The International Federation for the Abolition of State Regulation of Vice, with an object clearly stated in its name, is the most widely known of these associations. Headquarters are at Geneva where the official organ is published, and committees are established in each of the countries of Europe and in many other lands. This federation and its affiliated or kindred associations now publish sixteen periodicals, in seven different languages. The British committee, with Mr. Maurice Gregory as secretary, has offices at 17 Tothill Street, Westminster, S. W., London, where they publish *The Shield*.

The International Bureau for the Suppression of the White Slave Traffic, Mr. William Alexan-

der Coote, secretary, has headquarters at St. Mary's Chambers, 161a Strand, London, W. C. This bureau has a committee, known as the "National Vigilance Committee," established in each of the European countries and the U. S., *The Vigilance Record*, published in London, is the official organ. Dr. O. Edward Janney, of Baltimore, is the chairman of the committee in the U. S.

Other organizations in Great Britain that should be mentioned are:

The Social Purity Alliance, founded in 1873, which conducts general work. Official organ, *The Pioneer*. Secretary, Mr. Eric Hammond, 18 Tothill Street, Westminster, S. W., London.

The Alliance of Honour, 5 Beresford Road, London, N., Dr. Harry Grattan Guinness, president, is one of the strongest purity associations for young men in the world.

The Boys' Purity Band, B. McCall Barbour, organizer, 37 Chambers Street, Edinburgh, Scotland, is doing a thorough work for boys and publishing an excellent line of literature.

The White Cross societies and Travelers' Aid are also doing an extensive work in Great Britain and other parts of Europe.

In the U. S., while the movement is not so far advanced as in Europe, and possibly not as progressive, there are a number of organizations of importance. It will be sufficient to mention these by name, with the distinguishing work of each, to give a comprehensive review of the movement in this country:

The New England Watch and Ward Society; secretary, J. Frank Chase, Boston, Mass. The oldest purity society in the U. S. Combats obscene literature, gambling, and vice; of late is entering more into a general work.

The New York Society for the Suppression of Vice; secretary, Anthony Comstock, New York City. Efforts devoted principally against obscene literature and degrading instruments of vice.

The American Purity Alliance; secretary, Percy Russell, New York City. Opposes state regulation of vice. Official organ, *The Philanthropist*.

The National Christian League for the Promotion of Social Purity; president, Mrs. Elizabeth B. Grannis, New York City. A general work.

The National Purity Association; president, J. B. Caldwell, Chicago. Purity in marital relations. Official organ, *The Purity Journal*.

The American Society of Sanitary and Moral Prophylaxis; president, Dr. Prince A. Morrow, New York City. Aim, to limit the spread of diseases which have their origin in the social evil.

The Northwestern Purity Association; secretary, Clara O. Steadwell, La Crosse, Wis. A general work.

The Canadian Purity-Education Association; secretary, Rowena G. D. Hume, Toronto. A general line of purity and educational work.

The International Reform Bureau; superintendent, Rev. Wilbur F. Crafts, Washington, D. C. Legislative and publicity bureau. Issues regular bulletins and pamphlets.

The National Purity Federation; president, B. S. Steadwell, La Crosse, Wis. A federation of leading purity organizations for the purpose of promoting the purity movement in a national sense, through union of effort and the holding of national and international congresses. Official organ, *The Light*.

These organizations are representative of the movement in America, and with the White Cross and White Shield societies, and the departments for purity and moral education in such well-known organizations as the Woman's Christian Temperance Union, the Young Women's and the Young Men's Christian Associations, the King's Daughters, the National Council of Women, the Congress of Mothers, and the numerous Law and Order societies in our principal cities, constitute the chief agencies for the advancement of social purity.

A branch of the general movement operates under the name of "Rescue Work." Homes for the shelter and redemption of erring and betrayed girls and women, and for the rescue of

female inmates from the houses of shame, are established in all the larger cities of the civilized world. These homes are usually under the management of local societies known as "Rescue Leagues." Great Britain and the Continent lead in the number of these institutions. In the U. S. there are more than two hundred of such homes. Over sixty of these are under the supervision of the National Florence Crittenton Mission, Mr. Charles N. Crittenton, president, Washington, D. C. The Door

Rescue Work

of Hope homes number also more than sixty, Mrs. E. M. Whittemore, of New York City, being the founder. Nearly every city of importance has its Good Shepherd Home under the management of the sisters of the Catholic Church. Connected with each home there are usually from one to several missionaries or personal workers. As an adjunct to this work, homes are established in all large cities where working girls and women may obtain desirable board and lodging at a reasonable price and where their environment is made as homelike and safe as possible, thus sheltering them from many of the temptations of city life. B. S. STEADWELL.

SOCIAL SECRETARIES: A social secretary in industrial betterment is the name used for a man or woman added to the staff of a business firm whose duty it is to be the point of contact between the firm and its employees and to promote the interests—moral, physical, and industrial—of the employees.

The first social secretary was employed in 1889 in the United States and met with such success that several firms appointed similar secretaries. Four years later it was possible to hold a conference of social secretaries. In Great Britain Messrs. Rowntree & Co., of York, in 1891 engaged a lady social secretary to look after the interests of the women and girls in their employ, and the result was so satisfactory that they now have four social secretaries.

The first duty of a social secretary is to represent the firm in the engagement of employees, and frequently to represent the employers in the settlement of personal grievances. The main duty, however, is to study the welfare of the employees in every way, to suggest improvements in their conditions, to organize them into clubs, social enterprises, and various forms of improvement. At the same time he or she becomes the link between the employer and the employed, preventing friction and removing difficulties. If the secretary has good tact, common sense, and the welfare of the employees at heart, he or she can be of very great service both to the employees and to the firm. This requires naturally the basing of action not on philanthropy but on what is reasonable. The good of the employees is in the long run the good of the firm, and the good of the firm is equally in the long run the good of the employees. Conspicuous among the American firms employing social secretaries are the Westinghouse Air Brake Company, the H. J. Heinz Company, the Ludlow Manufacturing Associates, the International Harvester Company, the National Cash Register Company, Filene's Store of Boston, the Shepard Company (department store) of Providence, R. I., the Curtis Publishing Company of New York, the Colorado Fuel and Iron Company, the Proximity Cotton Mills of Greensboro, N. C., Hamilton, Carhart & Co. of Detroit, and the Siegel-Cooper Store in New York. On the Continent of Europe less

is done in this line, altho it is being commenced. A social secretary was employed by the Van Marken Works in Holland as early as 1894. Various French firms have such secretaries, altho many firms reach the same results in different ways.

SOCIALISM: See the following articles for different portions of the subject, from different points of view:

"Socialism, Definition of and Arguments for," by W. D. P. Bliss.

"Socialism, History of," by Morris Hillquitt.

"Socialism, International," by William J. Ghent.

"Socialism, Objections to," by Prof. J. E. Le Rossignol.

"Socialist Party, U. S.," by William Mailly.

See also CHRISTIAN SOCIALISM; COLLECTIVIST SOCIETY; FABIAN SOCIETY; LABOR PARTY (English); INDEPENDENT LABOR PARTY (English); SOCIAL DEMOCRATIC FEDERATION; REVISIONISTS; SOCIALIST LABOR PARTY (U. S.); SOCIALISTS OF THE CHAIR; COMMUNISM; INTERNATIONAL; NATIONALISM; PUBLIC OWNERSHIP; etc.

I. General Definition

The word socialism (from Latin *socius*, a comrade, an associate) was probably first used in the later agitation of Robert Owen from 1830-40, and first popularized in Reybaud's "Études sur les Réformateurs ou Socialistes Modernes" (1840), to express the general tendency to develop a communal or cooperative organization of society in place of the existing competitive state of society. The word, however, in the evolution of social reform, has come—at least in Germany, England, and the United States—to be limited in general use to that effort for the cooperative organization of society which would work through government (national, State, or local). This is by no means to identify socialism with a mere expansion of the functions of the State. Socialists only believe in a fraternal State. Paternal State socialism all Socialists unanimously oppose, save as paternal governments introduce measures leading toward fraternal cooperation. In Germany, where the government is largely paternal, the phrase State socialism is used for the expansion of its paternal functions, and is strenuously opposed by the Socialists. In the U. S. and England, where the ideal of government is democratic, Socialists usually declare themselves State Socialists. Said a report issued in 1896 by the Fabian Society (*q. v.*):

The socialism advocated by the Fabian Society is State socialism exclusively. The foreign friends of the Fabian Society must interpret this declaration in view of the fact that since England now possesses an elaborate democratic State machinery, graduated from the parish council or vestry up to the central Parliament, and elected under a franchise which enables the working class vote to overwhelm all others, the opposition which exists in the Continental monarchies between the State and the people does not hamper English Socialists.

By the derivation of the word, by its history, by its use by Socialists themselves, socialism is the very opposite of paternalism. Owen, Fourier, Blanc, Marx, Engels, Lassalle, Bebel, Maurice, Hyndman, Morris, Fabians—where is there a governmental paternalist among Socialists of any school? Socialism is in essence economic comradeship. The State is, but the means; a co-operative commonwealth is the end.

Says John Stuart Mill (*Fortnightly Review*, April, 1879):

What is characteristic of socialism is the joint ownership by all the members of the community of the instruments and means of production, which carries with it the consequence that the division of all the produce among the body of owners must be a public act performed according to the rules laid down by the community.

Says Engels ("Die Entwicklung des Sozialismus von der Utopie zur Wissenschaft"):

The first act in which the State really appears as the representative of society as a whole, namely, the seizure of the means of production in the name of society, is at the same time its last independent act as a State. Interference of the state in social relations gradually becomes superfluous in one department after another, and finally of itself ceases (goes to sleep). The place of government over persons is taken by administration of things and the management of productive processes.

Bebel ("Die Frau und Sozialismus," pp. 312-314) argues that, under socialism, ministers, parliaments, armies, police, courts, attorneys, taxation, will all disappear, their place being taken by administrative colleges or boards. That this is the correct and generally accepted conception of socialism, and that there is no ground for the assertion frequently, nevertheless, made, that Socialists themselves are not agreed on the use of the word, can be seen by the following definitions which, tho using different phraseology, are in almost absolute essential agreement.

Says Friedrich Engels (Marx's lifelong friend and the editor of his literary remains), describing socialism in his "Socialism, Utopian and Scientific," translated by E. Aveling:

With the seizing of the means of production by society, production of commodities is done away with, and simultaneously the mastery of the product over the producer. Anarchy in social production is replaced by systematic, definite organization. The struggle for individual existence disappears. . . . The whole sphere of the conditions which environ man, and which have hitherto ruled man, now comes under the dominion and control of man, who now for the first time becomes the real conscious lord of nature, because he has now become master of his own social organization. . . . It is the ascent of man from the kingdom of necessity to the kingdom of freedom.

Says a manifesto of the joint committee of all English Socialist bodies (1893):

Our aim, one and all, is to obtain for the whole community complete ownership and control of the means of transport, the means of manufacture, the mines, and the land. Thus we look to put an end forever to the wage system, to sweep away all distinctions of class, and eventually to establish national and international communism on a sound basis.

Says Paul Lafargue, a typical French Socialist and son-in-law of Karl Marx (in *Le Figaro*):

Socialism is not the system of any reformer whatever; it is the doctrine of those who believe that the existing system is on the eve of a fatal economic evolution which will establish collective ownership in the hands of organizations of workers, in place of the individual ownership of capital.

Says Professor Schäffle, of Austria ("Quintessenz des Sozialismus"):

The alpha and omega of socialism is the transformation of private and competing capitals into a united collective capital.

Says Prof. R. T. Ely, of the U. S. ("Socialism and Social Reform," p. 19):

The results of the analysis of socialism may be brought together in a definition which would read somewhat as follows: Socialism is that contemplated system of industrial society which proposes the abolition of private property in the great material instruments of production, and the substitution thereof of collective property; and advocates the collective management of production, together with the distribution of social income by society, and private property in the larger proportion of this social income.

So, too, agree the dictionaries and encyclopedias. Says the "Encyclopædia Britannica" (article "Socialism," by Thomas Kirkup):

Whereas industry is at the present carried on by private capitalists served by wage-labor, it must be in the future conducted by associated or cooperating workmen jointly owning the means of production. On grounds both of theory and history this must be accepted as the cardinal principle of socialism.

The Standard Dictionary defines socialism as:

A theory of civil polity that aims to secure the reconstruction of society, increase of wealth, and a more equal distribution of the products of labor, through the public collective ownership of land and capital (as distinguished from property), and the public collective management of all industries.

Says the Century Dictionary:

Socialism is any theory or system of social organization which would abolish entirely or in great part the individual effort and competition on which modern society rests, and substitute for it cooperative action; would introduce a more perfect and equal distribution of the products of labor, and would make land and capital, as the instruments and means of production, the joint possession of the members of the community.

Summing up these definitions, socialism may be said to be the collective ownership of the means of production by the community democratically organized and their operation cooperatively for the equitable good of all.

Together, however, with this agreement as to what socialism is, it must be admitted that there is more difference of opinion as to the methods to be used in attaining the end. All

Schools of Socialism Socialists to-day agree in working through the State, and so, both in theory and fact, are wholly differentiated from all forms of anarchism and

anarchist communism, from which in the incipency of the Socialist movement they were not wholly differentiated. (See INTERNATIONAL.) But, beyond this general agreement, considerable differences exist. A large majority of the members of the avowed Socialist political parties believe that socialism will and must come by the organized political and economic efforts of the working classes, including among them those who, tho personally belonging to other classes, nevertheless accept this view and so adopt what is called the "class-conscious" basis, which is international and revolutionary, tho it is recognized by all Socialists that this economic revolution must come in more or less evolutionary way. These Socialists being admittedly, at present, at least, the large majority of the organized political Socialist movement, claim that they have the right to determine the use of the word socialism and to refuse to recognize as Socialists any who do not accept this view, which they consider vital and fundamental. For a statement of their views, see article SOCIALISM, INTERNATIONAL, by W. J. Ghent. This school of Socialists is, however, subdivided into two classes: (1) of those who accept the class-conscious position and work for a more or less catastrophic political uprising to establish socialism (at least in large measure), scorning meanwhile almost all ameliorative measures as reactionary, obscuring the real issue, tending to delay the final end and put people on the wrong track; and (2) of those who, accepting also the class-conscious position, nevertheless believe in working from this standpoint for more or less ameliorative measures to be attained in any way. Such Socialists bear different names in different countries, but in Germany are usually called

Revisionists. (See articles REVISIONISTS and BERNSTEIN, their main leader.) In Germany and most countries they are becoming the majority.

The second main school of Socialists do not accept the class-conscious position and usually do not belong to avowed Socialist parties, tho often voting the Socialist ticket, and are therefore not considered true Socialists by the other school. But since they do accept the general Socialist aim and work for it in the way they consider wisest; and since, too, they are a very large number, and perhaps even a majority of those calling themselves Socialists, they believe that they have a perfect right to the name, altho not of the party. This school is frankly and avowedly opportunist, believing in working for Socialism through any party and in any way that at any given time and place will best promote the common end. They form probably the majority of the working classes of Great Britain and the U. S., the majority of the whole population of New Zealand and Australia, a large number of working men in all countries, and also in all countries a very considerable and rapidly growing number of the so-called intellectual and middle classes. To them, as to all Socialists, socialism is an historic, economic, and fundamentally revolutionary change in the constitution of society. They do not limit the movement, however, to any form, nor to the efforts of any one class, tho they recognize that undoubtedly a large and probably at least a quantitatively leading portion of the movement will be played by the working classes. Most of them believe that in almost all countries there should be and will be developed new independent parties, working for socialism, and perhaps under its name, tho not of necessity so, yet on a wider basis than existing Socialist parties. The most advanced actual carrying out of this view is in New Zealand and in some English municipalities. The best known and most influential group advocating this view is the English Fabian Society (*q. v.*), whence it is often called Fabian Socialism. This general school, too, is subdivided into many varieties of view, for which see the opening paragraph of this article. Such Socialists, however, all deny that the particular economic interpretation of history adopted by Karl Marx, identified with his name, and developed by his followers, is the only scientific view. While they accept much of the Marxist view, they deny emphatically that that view is correctly called "Scientific Socialism." Only gradually, they assert, and by incorporating many views and various elements, are we slowly and partially working out a scientific interpretation of history and of social phenomena.

It belongs also to this view, and is, indeed, admitted by Socialists of the orthodox type, that while the aims of socialism and even general methods may be one, details must differ in different countries. There is no Socialist system

for society, because socialism is not a system, but an evolution, a tendency, a principle. It is as flexible in its form as it is definite in the principle.

Any system that would carry out its principle is socialistic. In Germany to-day its chief aim is national development. In France it makes less of the nation and more of the commune. In Belgium it comes very near to cooperation, and yet is socialism not cooperation. In England it is municipal, and in a growing degree

parliamentary. In the U. S. it will probably follow our political divisions of states, counties, municipalities, townships, and the nation. Socialism, therefore, is not Fourierism, nor Marxism, nor Bellamyism. Says Sidney Webb: "It seems almost impossible to bring people to understand that the abstract word socialism denotes, like radicalism, not an elaborate plan of society, but a principle of social action."

All Socialists, too, are agreed that many elements often identified in the popular mind with socialism have no necessary connections with it. A report of the Fabian Society says:

The object of the Fabian Society is to persuade the English people to make their political constitution thoroughly democratic and so to socialize their industries as to make the livelihood of the people entirely independent of private capitalism.

The Fabian Society endeavors to pursue its Socialist and democratic objects with complete singleness of aim. For example:

It has no distinctive opinions on the marriage question, religion, art, abstract economics, historic evolution, currency or any other subject than its own special business of practical democracy and socialism.

Professor Schäffle, in his "Quintessence of Socialism," shows that some Socialists believe in and practise free love—some individualists also do—but that socialism as a system has no necessary connection with loose family relationships. Many Socialists believe that only socialism can save the family. Nor is there more authority for identifying socialism with anarchy. Theoretically, the two are opposites, and practically they are opposed.

Most modern Socialists oppose communism (*q. v.*), ordinary local cooperation, and the establishment of communistic colonies. Some Socialists believe that under certain conditions local experiments in these directions may be wise as temporary means of education or of economic living, and where cooperation has got an established hold, as in England and Belgium, Socialists are learning the wisdom of working with the co-operators (see COOPERATION), but where local cooperation experiments or colonies are put forth as in themselves a sufficient ideal to work for, or where they are attempted, as they often have been in the U. S., under conditions too weak to compete against the competitive civilization with which they are surrounded, Socialists oppose such efforts as reactionary and unwise. It follows once more from the evolutionary idea that Socialists to-day spend little time in dreaming of the future. To the future the future may be left. Content with a firm grasp on their central aim Socialists are learning more and more to concentrate their efforts on the present political battle, and to leave the details of the future to the decision of circumstances. Says Mr. Kidd, speaking of this policy ("Social Evolution," p. 206):

We have not now to deal with mere abstract and transcendental theories, but with a clearly defined movement in practical politics, appealing to some of the deepest instincts of a large proportion of the voting population, and professing to provide a program likely in the future to stand more on its own merits in opposition to all other programs whatever.

Socialists, however, urge that there is not only an evolution of socialism but an evolution toward socialism. Many Socialists, indeed, believe that this is the most important portion of the development. Such Socialists point to and rejoice in the steady growth of monopolies, trusts, and concentrated wealth on the one hand, coupled, on the other hand, with the steady advance of democratic tendencies among the masses of all coun-

tries. They tell us that the choice lies between private monopoly, which is tyranny, and public monopoly, which is socialism, between the combination of the few and the cooperation of all. They say that the State must own the railroads, or the railroads own the State. Nor is the argument weakened by the fact that, among certain portions of the educated classes, there is a reaction against democracy. This reaction is largely caused by fear of a Socialist democracy, and this rather shows the advance of socialism.

Other Socialists find more evidence of the advance of socialism in the steady expansion of the function of the democratic State. This is admitted by those who most oppose it.

Of England Herbert Spencer says:

Evolution "The numerous socialistic changes
Toward made by act of Parliament, joined
Socialism with numerous others presently to be made, will by and by be all merged in

State socialism; swallowed in the vast wave which they have little by little raised." Of this advance Mr. Sidney Webb writes in the "Fabian Essays":

Slice after slice has gradually been cut from the profits of capital, and therefore from its selling value, by socially beneficial restrictions on its user's liberty to do as he liked with it. Slice after slice has been cut off the incomes from rent and interest by the gradual shifting of taxation from consumers to persons enjoying incomes above the average of the kingdom. Step by step the political power and political organizations of the country have been used for industrial ends.

Even in the fields still abandoned to private enterprise, its operations are thus every day more closely limited, in order that the anarchic competition of private greed, which at the beginning of the century was set up as the only infallibly beneficent principle of social action, may not utterly destroy the State. All this has been done by "practical" men, ignorant, that is to say, of any scientific sociology; believing socialism to be the most foolish of dreams, and absolutely ignoring, as they thought, all grandiloquent claims for social reconstruction. Such is the irresistible sweep of social tendencies that in their every act they worked to bring about the very socialism they despised.

Evidences of this are in all countries, particularly in Europe and New Zealand. Hundreds of public services formerly carried on by private enterprise are now carried on by government, while very rarely does a service conducted by the State change to private conduct. If evolution means the survival of the fittest, public ownership is rapidly proving itself the coming order. (See MUNICIPALISM; LIGHTING; RAILROADS; etc.) A great change, too, has come over public thought. In the development of avowed socialism there come tidal waves of action and reaction, but the steady advance of general socialistic thought is one of the marked characteristics of the day. The significance and the real socialism of the so-called Socialists of the Chair (*q. v.*) and the confessions of English economists may have been exaggerated by some, but the very reaction shows the extent to which the change has gone. Says Sidney Webb ("Fabian Essays"):

Changes
in Thought

The publication of John Stuart Mill's "Political Economy" in 1848 marks conveniently the boundary of the old individualist economics. Every edition of Mill's book became more and more socialistic. After his death the world learned the personal history, penned by his own hand, of his development from a mere political democrat to a convinced Socialist. The change in tone since then has been such that one competent economist, professedly anti-Socialist, publishes regretfully to the world that all the younger men are now Socialists, as well as many of the older professors. It is, indeed, mainly from these that the world has learned how faulty were the earlier economic generalizations, and, above all, how incomplete as guides for social or political action.

Says Professor de Laveleye:

It was at one time imagined that the means of combating socialism would be found in the teachings of political economy; but, on the contrary, it is precisely this science which has furnished the Socialists of to-day with their most redoubtable weapons. (Introduction to "Socialism of To-day.")

A similar change has come over religious thought. Christian Socialism under some form has appeared in all Christian lands. Says Professor Kirkup, in his article on socialism, in the "Encyclopædia Britannica": "The ethics of socialism are closely akin to the ethics of Christianity, if not identical with them." Says Professor de Laveleye (Introduction to "Socialism of To-day"): "Every Christian who understands and earnestly accepts the teachings of his Master is at heart a Socialist, and every Socialist, whatever may be his hatred against all religion, bears within himself an unconscious Christianity."

At the London Diocesan Conference of May 16, 1906, it was voted, 58 to 13, that the principles of socialism were calculated to promote the general welfare of the community in Church and State.

Professor Schäffle long ago said: "The future belongs to the purified socialism" ("Bau und Leben des Sozialen Körpers," vol. ii., p. 120).

II. Arguments for Socialism

1. The fundamental argument for socialism is that it will mean a personal liberty to-day disappearing under the stress of economic competition and the resultant development of private monopolies. A man cannot be said to be free to-day who on penalty of starvation for himself and his family is compelled to work at some manual or machine task, allowing of little creative action, or intellectual interest, and often more strenuously than the slaves of any age, and all for a pittance barely more than will sustain life under modern conditions. Yet such is the present

economic condition of vast portions of the human race in all civilized countries. (See WAGES; WEALTH.) Nor can those more economically fortunate and successful be said to be free when almost all branches of

trade are dominated by the very few. The ownership of shares in trusts many believe to be spreading, but all admit a marked and startling concentration at least of the control of wealth. This condition limits, too, the freedom of the intellectual classes; the journalist employed by a millionaire (it takes a million dollars to establish a great modern daily), the educator engaged by a university of necessity supported by the donations of the wealthy, the clergyman receiving a salary from the well-to-do, can scarcely be said to be economically free. Socialists believe that under any system of competition, even when the natural values of the soil are unmonopolized, economic power *must* go to the shrewd, the able, and often the unscrupulous; that this power will enable them to secure more power, so that eventually, under any system of economic competition, the many will become, as to-day, economic dependents on the few. How much freedom the average individual has under individualism we see in Mill's declaration that "the restraints of communism would be freedom in comparison with the present condition of the majority of the human race." Socialists urge, therefore, that, exactly as government, through law and the police, protects the man physically weak from

Socialism
Necessary
to Freedom

aggression at the hands of the physical bully or giant, has so developed, not a perfect but a comparative physical freedom, and made possible a competition higher than physical, so government should protect the economically weak from the hands of economic giants and bullies, should introduce cooperation in place of competition, and so make possible a competition higher than economic. As in Periclean Athens (see **ATHENS**), socialistic legislation for the free citizens made it possible for them to live without economic competition or stress, it freed the individual to compete in art, beauty, literature, philosophy, and so produced an amount of individuality elsewhere unapproached in the world. In no country in the civilized world is there so little developed socialism as in the U. S., and in no country in the world is there such concentration of economic power and such rule by money over all classes of society. Under socialism, relieved from the necessity of concentrating all energies on getting a living (as is largely necessary to-day in the U. S., even for the well-to-do), a man can be free to think his own thoughts, to live his own life, to do his own deeds, to be free. This is the fundamental claim of socialism.

It is said in answer to this that economic production will thereby be decreased, since it would take away from the worker the spur of self-interest, which is declared to be the main economic spur of the world. The U. S. is adduced as economically the most productive, inventive, and progressive country of the world. It is declared that here wages are the highest, prosperity the most diffused, economic security the greatest, and therefore there is here, in this sense at least, the greatest possible freedom. It is argued that only by our captains of industry being allowed the spur of enormous gains have they developed the great systems of industry which have brought such prosperity to the many. To limit the possible returns of great capitalists, we are told, would be to kill the goose that lays the golden egg for the whole community. In Germany, and to a less extent in Great Britain and other countries where the operations of capitalists are more fettered by legislation, more or less socialistic, we are reminded that there has been no such progressive industrialism and production as in the U. S.

To this it is argued by Socialists that it is true the U. S.—commencing her national life on a new continent, and with unlimited natural resources,

at a time when economic competition was in its first full swing, and giving away for nothing, to the few who could make use of them, vast privileges and franchises which have become, as population grew, of enormous value—has developed an economic production elsewhere unequaled. It is true that this has brought a substantial prosperity to many. It is true also that unwise legislation and the fettering of industrial initiative would undoubtedly lessen such production. But this does not prove that wise legislation and a gradual socialistic organization of society would lessen production. The modern country which undoubtedly has made the most rapid progress in economic production next to the U. S. is Germany, the large country where there has also been the greatest amount of socialistic legislation. Indeed, while the U. S. has doubtless produced the greatest number of millionaires and material product, it is not proven that, considering prices of

both the pleasures and comforts of life, the ordinary workingman has much, if any, more joy of life in the U. S. than in Germany. It must be remembered, too, that the U. S. has had the enormous advantage of a continental domain calling for settlers and for capital to develop transit, etc., for those settlers. Whether the U. S., with these economic advantages, but the development of a strong central government controlling private initiative and operating the public utilities for the good of all, might not have developed a still greater economic production, is at least an open question. For her capitalistic production in any case the U. S. has paid an enormous price, in a government corrupted by gigantic corporations (see **CORRUPTION**), business demoralized by dealings at which the world stands aghast, adulterations of food, drugs, and materials, from which we are only beginning to be saved by socialistic legislation; purchasers robbed by prices which largely take away the benefit of high wages, charges for public service of transit, light, telegraph, telephone, expressage, the highest in the world, and also in many ways the most reckless of human life and careless of the public good. It is doubtful if the difference between the natural production and the number of millionaires in the U. S. and Germany is worth this frightful cost. In very many important respects Germany is ahead. New Zealand (*q. v.*), again, tho a small country, is making important economic advance under the most socialistic institutions of the world. The country has yet to be found where economic production has been lessened by socialistic legislation.

That the asserted lack of invention and expansion of public conveniences in socialistic countries is not due to their socialism, but to general racial characteristics, is shown, too, by the fact that this lack of progress exists quite as much in realms not at all affected by the socialistic laws, while Public Ownership in these countries has in every case largely produced expansion and improvement. (See **PUBLIC OWNERSHIP**.)

It is not true that government production is expensive compared with private operations, save in those municipalities and states corrupted by private corporations working through party bosses. (See **CORRUPTION**.) Public ownership and operation is winning its way around the world on its economic merits. (See **PUBLIC OWNERSHIP**.)

Nor is it true again that public ownership is less progressive than private. In any given country where both systems have been tried, as in street-railways, lighting, etc., the public-owned services have been proven the most progressive. (See **PUBLIC OWNERSHIP**.) In the U. S. the post-office has been far more progressive than the private Western Union Telegraph Company. (See **POSTAL SERVICE**.) Our public schools are almost universally superior to private schools, our state universities to private universities, except for a very few very highly endowed beneficiaries of vast private wealth. Patents (*q. v.*) are repeatedly bought up by private companies to prevent their being put on the market.

Socialists, too, deny that hope of economic gain is the greatest spur to inventiveness and action.

The greatest inventions of the world have not been made for gain. Socialists do not propose to abolish competition, only to substitute competi-

tion for honor in place of competition for gain. And in so doing they appeal to one of the deepest human motives. Says Mrs. Besant (in the "Fabian Essays"):

The desire to excel, the joy in creative work, the longing to improve, the eagerness to win social approval, the instinct of benevolence—all these will start into full life, and will serve at once as the stimulus to labor and the reward of excellence. It is instructive to notice that these very forces may already be seen at work in every case in which subsistence is secured, and they alone supply the stimulus to action. The soldier's subsistence is certain, and does not depend on his exertions. At once he becomes susceptible to appeals to his patriotism, to his *esprit de corps*, to the honor of his flag; he will dare anything for glory, and value a bit of bronze, which is the "reward of valor," far more than a hundred times its weight in gold. Yet many of the private soldiers come from the worst of the population; and military glory and success in murder are but poor objects to aim at. If so much can be done under circumstances so unpromising, what may we not hope from nobler aspirations? Or take the eagerness, self-denial, and strenuous effort thrown by young men into their mere games! The desire to be captain of the Oxford eleven, stroke of the Cambridge boat, victor in the foot-race or the leaping—in a word, the desire to excel—is strong enough to impel the exertions which often ruin physical health. Everywhere we see the multiform desires of humanity assert themselves when once livelihood is secure.

The second main argument is that socialism will purify government. To day it is becoming very generally admitted that the main cause and source of governmental corruption is the great corporation or monopoly, whose need of franchises and favorable legislation is the corrupt politician's stock in trade, and the chance to sell which, under one form or another, is the one thing which attracts him into politics and makes it worth while for him to organize a ring and control elections. Compare article CORRUPTION, p. 326, where Mr. Steffens is quoted as saying, "Not the politician then, not the bribe-taker, but the bribe-giver, the man we are so proud of, our successful business man—he is the source and sustenance of our bad government. The captain of industry is the man to catch." Socialism would do away with these sources of corruption by taking economic power from the few and giving it to the many. Socialism would interest the good man in government. Says Prof. R. T. Ely (*The Christian Union*, Oct. 9, 1890):

We are reversing the order of nature in planning to reform city government first and then to carry out changes and to make improvements in behalf of the poorer classes. Let any one name a city where this policy has been successfully pursued. I know of none.

When civil-service reformers in New York come before the people with large and generous plans of reform, with a program including adequate school accommodations, strict enforcement of the compulsory education law, better sanitary measures, public ownership and management of gas and electric-light plants, playgrounds for children, public parks in crowded sections, and strict enforcement of laws for the protection of working children, and when leading citizens pledge themselves to these reforms they will arouse an enthusiasm which will sweep the city.

Another fundamental fact is that the program which I propose will, when carried out, arouse municipal pride and self-respect. It will awaken what you may call a self-consciousness. Cities with us do not, as it were, respect themselves. They are like men who have lost their self-respect, while they are despised by private corporations, whose tool they become.

This has been the actual result of public ownership in England and wherever tried. Birmingham, where this phase of the movement largely began, had up to its inception the reputation of being one of the most corrupt boroughs in England. Since that policy has been developed it often has been spoken of as "the best governed city in the world." It is a natural result. When

a city or state does large things for its citizens, the citizens naturally take a healthy and proper interest in it. Complete civic purity is not developed in a day; but no one hears much of gross civic scandals where public ownership is highly developed. Corruption breeds almost solely where the ordinary citizen has little interest in the government and private interests have enormous favors to gain from corrupt councilors or officials.

As for the continually asserted argument that socialism would better liberty by putting all life under the control of a bureaucracy, it is to be said that this is based on an utter misunderstanding of what socialism is. Socialism is everywhere, in practice, constructive and positive, not negative. It says you may have cheap postage, transit, higher wages, better homes. It does not forbid private railroads, but introduces nationalized railroads so much cheaper and better that private roads disappear. This is socialism as it is actually evolving. Its bureaucracy is a myth of its opponents, based on some foolish outgrown Socialist Utopias.

The supreme argument for socialism, however, is that it will produce not only freer but a higher type of men and women. Those who argue that we need economic competition because character is so developed forget that competition develops strength primarily in that field of effort only in which the competition takes place. Character tends to be what men strive for. If men concentrate attention on industrial competition, they tend to develop materialism and shrewdness. This is exactly what we have to-day. Artists complain that commercialism is killing art; religionists say we are growing material; the bourgeois middle class boast of our material prosperity. It is the natural result of industrial competition. Under socialism, if men seek to serve the public it will produce a higher character.

Once competition was mainly physical. With naked hand or rudest club men fought for existence; later, with poisoned arrow and hurtling spear they battled for the best fisheries and the richest hunting-grounds. It produced physical individuality, the physical giant, the Nimrods, the Achilles, the Agamemnons, kings of men. Then came a competition a little more intellectual, producing an

Alexander, a Richard Cœur de Lion, finally a Napoleon. Next came the modern world where men battle, not with poisoned spears, but with poisoned groceries; not with clubs and spears, but, like bulls and bears, with cornerings of the market and tricks of stock. It has produced the Jay Gould and the Baron Rothschild. Now comes socialism, and says, Let us cooperate in industry, and compete only to see who shall best serve the public. Is it not easy to see what kind of an individuality it will gradually produce? The development of species by environment is one of the commonplaces of science to-day, as brilliantly shown by Mrs. Gilman (q. v.) and proven by most careful scientists.

Germany, where government does so much, has produced the best trained and most effective public servants.

The assertion is often made, nevertheless, that Socialists are materialistic, irreligious, free-lovers, disrespects of property, etc., etc.

Mr. Lecky's "Democracy and Liberty" argues that the sense of right and wrong is the basis of the respect for property and for the obligation of

¹ 0 means none; . . . means unknown.² Estimated.³ Fifty-five Party Socialists and 20 Independent Socialists, besides 136 Socialist Radicals.⁴ 1904.⁵ The portion of the total electorate corresponding to the proportion of Labor members in the Australian federal House of Representatives. The Australian Labor Party is practically a Socialist Party.⁶ Labor members elected to the federal House of Representatives. In the separate Australian state legislatures there are many more Labor representatives—34 in Queensland alone, 25 in New South Wales, 18 in Victoria.⁷ The portion of the total electorate corresponding to the proportion of the Labor group in the House of Commons.⁸ In the Labor group. Of these, only 2 were elected as strict Party Socialists, representing the Social Democratic Federation; but 7 belong to the Independent Labor Party, which is explicitly socialistic, and 13 more belong to the Labor Representation Committee, which is practically socialistic, and 6 more still are Fabian or economic Socialists elected as radicals. Of the remaining 16 in the Labor group, if any are not socialistic they are more than balanced by those who favor Socialist measures among the Liberals, Irish Unionists, and Nationalists. The number in Parliament favoring most Socialist measures is probably nearer 100 than 45.⁹ The portion of the electorate corresponding to the proportion of estimated Socialist members in the House. Almost all parties in New Zealand are more or less socialistic.¹⁰ Social Democrats and Group of Toil in the Second Duma.¹¹ Members of Socialist Party.¹² The portion of the electorate corresponding to the proportion of Socialist Deputies.¹³ As in England candidates must bear the cost of the election, Socialist candidates were nominated only in five parliamentary districts.¹⁴ Of these 28 are dailies. The large numbers are in countries where the trade-union papers are also Socialist papers.

¹ Estimated Labor vote, not from Socialist report.² Including other minor countries.

contract, and that it is being subverted by Socialists.

We are told that in England the Fabian Society is committed in its declared principles to the transfer to the community of land and industrial capital "without compensation (tho' not without such relief to expropriated individuals as may seem fit to the community)," that the Social Democratic Federation has as a plank in its platform "the repudiation of the national debt," that in the U. S. Henry George ("Social Problems," pp. 213-221) argues it as "a preposterous assumption that one generation should be bound by the debts of its predecessors."

In Germany, Bebel, in his "Woman," argues for "free love." Deville, a French Socialist, is quoted as saying:

Marriage is a regulation of property. . . . When property is transformed, and only after that transformation, marriage will lose its reason for existence, and boys and girls may then freely and without fear of censure listen to the wants and promptings of their nature. . . . The support of the children will no longer depend on the chance of birth. Like their instruction, it will become a charge of society. There will be no room for prostitution or for marriage, which is in sum nothing more than prostitution before the mayor.

Mr. Morris and Mr. Bax, in their "Socialism, in its Growth and Outcome," contend that "marriage should be a voluntary association, dissoluble by either party at pleasure."

It is perfectly true that such quotations and many other similar ones can be found on the pages of Socialist writers. They can also be found to at least the same extent on the pages of individualistic writers. (See FAMILY; CURRENCY; etc.) Socialism per se has no views on these questions. But as to the family, marriage, etc., how many family quarrels and divorces have their root in dissensions over money. This cause of family disruption socialism would largely remove, since all in a socialistic state would inherit equally from the State, at least in proportion to their need. Again, how far economic pressure to-day is destroying the home is seen in the articles HOMES, OWNERSHIP OF; OVERCROWDING; TENEMENTS. Socialism would make it possible for every man and woman to have a home. It would take the money root out of marriage, and make marriages for love, not for money or home or maintenance. Which system is likely to produce the truest homes and the most permanent marital relations? The wisest State legislation as to marriage is a separate question. (See DIVORCE.)

It is perfectly true, however, that the large majority of avowed Socialists are divorced from recognized religion and the Church, and that this does lead many of them to extreme radicalism on all questions of ethics, money, and the family. But what drives them to this? Unquestionably not the Christianity of the Church,

Socialism and Morals

but its lack of Christianity, its real or asserted mammonism, indifference to the demands of the people, and dependence upon and subservience to wealth. (See THE CHURCH AND THE WORKING-MAN.) However much these things may have been exaggerated or the facts distorted, no one who knows working men denies that these things exist, at least in the belief of the working men, while all those who know them best wonder not at the ir-religion and radicalism of the working classes, but at their freedom from radicalism and their acceptance of conventional ideas. It is not socialism which produces the radical and the ethical freethinker. It is materialism, the worship of wealth, the mammonism of existing society. Socialism would at least diminish this. Conversion to socialism has made it possible for many a man to accept a rational religion. Many

consider socialism the religious revival of the world. Says Sidney Ball (*International Journal of Ethics*, April, 1896):

At first sight it seems true that character has not been put in the foreground of Socialist discussion; its emphasis appears to be laid almost exclusively on machinery, on a reconstruction of the material conditions and organization of life. But machinery is a means to an end, as much to a Socialist as to any one else; and the end, at any rate as conceived by the Socialist, is the development of human nature in scope, powers of life, and enjoyment. . . . The forces required to work collectivist machinery are nothing if not moral; and so we also hear the complaint that Socialists are too ideal, that they make too great a demand upon human nature and upon the social will and imagination. Of the two complaints this is certainly the most pertinent. A conception, however, which is liable to be dismissed, now as mere mechanism, now as mere morality, may possibly be working toward a higher synthesis. . . . If institutions depend on character, character depends on institutions; it is upon their necessary interaction that the Socialist insists.

As for the argument that under socialism parental responsibility would be weakened, and overpopulation result, John Stuart Mill ("Political Economy," bk. ii., chap. i.) has well said:

Another of the objections to communism is similar to that so often urged against poor-laws: that if every member of the community were assured of subsistence for himself and any number of children, on the sole condition of willingness to work, prudential restraint on the multiplication of mankind would be at an end, and population would start forward at a rate which would reduce the community through successive stages of increasing discomfort to actual starvation. There would certainly be much ground for this apprehension if communism provided no motive to restraint equivalent to those which it would take away. But communism is precisely the state of things in which opinion might be expected to declare itself with greatest intensity against this kind of selfish intemperance. Any augmentation of numbers which diminished the comfort or increased the toil of the mass would then cause (which now it does not) immediate and unmistakable inconvenience to every individual in the association; inconvenience which could not then be imputed to the avarice of employers or the unjust privileges of the rich. In such altered circumstances opinion could not fail to reprobate, and if reprobation did not suffice, to repress by penalties of some description, this or any other culpable self-indulgence at the expense of the community. The communistic scheme, instead of being peculiarly open to the objection drawn from danger of overpopulation, has the recommendation of tending in an especial degree to the prevention of that evil.

As for the biological argument, sometimes made against socialism, that the right of the strongest to survive and to gradually exterminate the weak is necessary to progress and even to the perpetuity of the

Socialism and Biology

race, and while socialism would at least check this, so that a country adopting socialism would soon be conquered by a race not adopting socialism, it is to be said that this might occur if socialism be conceived of as a system to be adopted by a country in one great economic upheaval. But no Socialists to-day believe in such an impossible catastrophic Utopianism. Even the most catastrophic Socialist believes in some evolution. Socialism is not the aiding of the weak at the expense of the strong. It is the gradual development of a new strength—the strength of public service to replace the strength of private service and to lift up the economically weak to a plane of increased efficiency where they, too, can compete in the public service, and thus produce a higher biologic progress. Socialism is yet a comparatively new movement, and has naturally made false claims and given rise to many mistakes and errors, both in thought and action; yet no student of socialism will deny that it is as rapidly growing in wise self-control as in numbers. A truly scientific and disciplined evolutionary socialism, and this is what is being evolved through political discussion and actual public ownership, will

make not a weaker but a stronger country. This socialism, not always recognized or acknowledged by all Socialists as socialism, has the future and on its adaptation to and adopting of human nature bases its modern argument.

SOCIALISM, DEFINITION OF (from standpoint of the International Socialist movement): To the organized international socialist movement must be granted the right to determine what is and what is not socialism, just as would be granted to the Pope and the College of Cardinals the right to declare what is true Catholicism, and to a Republican national convention the right to declare what is Republicanism. The famous utterance some fifteen years ago of Sir William Vernon Harcourt, "We are all Socialists now!" is merely an instance of a too common looseness of thinking and speaking. Socialism, tho informed and inspired by a spirit common to many men in all ages, holds to a definite doctrine, a definite program,

and incarnates itself in a definite movement, international and revolutionary.

Not many men, according to the orthodox school, are as yet real Socialists. Bebel said once—and it was when the German Social Democracy had polled some 1,400,000 votes—that there were probably not more than 200,000 thoroughgoing Socialists in Germany. There is thus a recognizable difference between Socialists and persons who vote or support the Socialist ticket, not to speak of persons who merely hold vague inclinations toward a collectivist order of society.

And yet it is a piece of folly, which every common-sense Socialist recognizes, to make overmuch of this distinction. The man who has now but a mere leaning toward socialism will next year, under the impress of new experiences, or the cumulative force of the totality of his experiences, be quite as ardent a Socialist as one who learned his lessons a decade ago. In the light of these considerations, society resolves itself into Socialists and potential Socialists on the one hand, and on the other those who, out of self-interest or temperamental obstinacy, are anti-Socialists. No more should be claimed for the international Socialist organization than that it is the core, the gravitational center of the greater movement without it.

As a doctrine, modern socialism is founded upon the materialist conception of history, or, as it might better be called, *the economic interpretation of history*. This economic interpretation of history sees the superstructure of society in all times, with all its institutions, its codes of morals and of laws, as a reflex of the prevailing system of production and distribution. It does not, as is often maintained, see in man's every action the spur of an economic impulse. It does not blind itself to countless individual acts of renunciation, of sacrifice, of martyrdom; but it *does* see a coloring

Principles

and an impress given to all human actions through this material environment. Men gladly give themselves to torture, privation, or death in behalf of a great cause, but the *cause* itself will almost inevitably be found to be a reaction from some form of social or economic oppression.

As a part of this economic interpretation of history, we have also the theory of a *class struggle*. Human activities, tho fundamentally individual, take on a collective form through the very necessities of social life. Men widely separated from one another, if working at like tasks, under like conditions, or suffering from like modes of oppression, instinctively react in like ways. They see the futility of individual revolt, and spontaneously they act in concert. They may be but barely conscious of their motives in resisting a wrong, or in seeking a political, social, or economic advantage. And yet, conscious or but partly conscious, or even unconscious of their motives, they tend to act in like ways under like conditions. Thus, history resolves itself into a series of struggles between possessing classes and non-possessing classes, attended by varying fortunes and carried on with but slight intermission through all the changes in modes of production. In our day the development of industry reaches a stage wherein we see steadily maintained a contest, however disguised, between a class of owners of the means of production and an increasing class of workers who own none of the means of production, but are employed at wage labor in producing wealth for the owners. It is a situation which, Socialists,

say, cannot last. Production has become social. That is, most commodities are produced by masses of men working in gangs or herds in great workshops. But ownership, which in varying degrees has been in past times common and social, has become individual and restricted to but an infinitesimal part of the population.

You may hold either one of two beliefs as to the manner in which the change will come. You may hold, as Marx and others of his time held, what has been called the "theory of increasing misery," which is, that the increasing concentration of wealth makes for a greater disparity of conditions between the owners and the workers—increasing the privation of the workers as it increases the wealth of the owners. And this development will bring about a stage wherein the workers, goaded beyond endurance, and having no other alternative, will put an end forever to the private ownership of the means of production. Or, you may still be a good Socialist and hold that the facts have not borne out this forecast. You may hold rather that with the growth of organization, economic and political, among the workers, they are bettering their lot materially, they are acquainting themselves more and more with the facts of history and of economics, and that by the increase of intelligence and thought, by an increased discipline and mutuality of effort—rather than through the spur of extreme privation—they will bring about this change. But whether you hold one theory or the other, you must, if you would be a good Socialist, hold that the change, when it comes, must be thoroughgoing and revolutionary, an abolition of the private ownership of the means of production.

The *program* of socialism is the securing of the political powers in every nation, the expropriation of capital, the holding of productive property in common—in a word, the co-operative commonwealth. This

Program

program is not to be achieved by paltering with compromises, by following the lead of economic Messiahs who constantly arise, and who deal out vast promises of what they intend to do for the benefit of the "dear people." It is to be achieved by the organized, disciplined effort of the class which has most to gain from such a program—the *working class*. This does not mean that all those who take part in the work of carrying forward this program are wage-laborers. As a matter of fact, many of those who have done the greatest work in formulating this program are men who have never done wage-labor. But the *working class* is the basis, because it is by reason of its material needs that it alone, when once aroused, can never be dissuaded from seeking to carry this program to its fulfilment. Men from other classes, through altruistic motives, may voice a hope for a juster order of life. There are periods, indeed, wherein many of those from the more leisurely walks of life have taken enthusiastic and determined part in movements for social regeneration. We have, perhaps, a better example of such endeavor in the great Fourierite movement of the forties than in any other. But these movements are necessarily superficial. They do not grow out of the instinctive demands of the workers, but out of the sentiments of a class not prompted by need. Such sentiments are easily shattered, for the best of men weary in well-doing. Only as those who come from other classes give over, renounce, and repudiate their allegiance to the class from which

they sprang; only as they come to see the historic mission of the working class and as they espouse the cause of the workers, making themselves an integral part of the working class, can they render real and lasting service toward the fulfilment of this program.

Finally, we have the organized Socialist movement, which is an embodiment of this spirit, of this doctrine, and this program. This movement, in its modern form, has but a brief history. It would be difficult to state the exact date or incident which might be called its beginning. It may be dated, if you will, from the publication of the Communist Manifesto in February, 1848; or the organization of Ferdinand Lassalle's Universal German Working Men's Association, in May, 1863; or the organization of the International Working Men's Association in September, 1864. But of many materials, heterogeneous, scattered, it has in forty years been aggregated and welded into a compact political body, reaching out into all the civilized parts of the globe. Persecution has for a time obstructed its growth, as, for instance, in Germany. It has had to meet ridicule, misrepresentation, the thunders of ecclesiastical denunciation; but in spite of all opposition, it steadily grows in numbers year by year, it carries its message to remote places, and year by year its menace to the existing order is more clearly recognized.

Socialism, the movement, carries on its work with a sleepless, an untiring energy; everywhere it is educating, organizing, and disciplining the working class and arming it, not with lethal weapons, but with knowledge and argument. Everywhere it opposes unjust wars, the rage of conquest, the oppression of capitalist class rule. It defends from legal persecution its Moyers and Haywoods; it relentlessly exposes the chicanery and pious fraud of those who dwell in high places. And this activity will go on and on, with cumulative force, despite transitory defeats and disheartenments, until the goal of a cooperative commonwealth is won.

W. J. GHENT.

SOCIALISM, HISTORY OF (see also articles SOCIALISM; SOCIALIST PARTY; UNITED STATES SOCIALIST LABOR PARTY; SOCIAL DEMOCRATIC FEDERATION; FABIAN SOCIETY; LABOR PARTY [ENGLISH]; CHRISTIAN SOCIALISM; COMMUNISM; NATIONALISM; INTERNATIONAL. For details, see also each leading country and the names of prominent Socialists). Some writers on the subject include in the history of the Socialist movement all ancient and medieval manifestations of communistic thought and institutions. But, as a matter of fact, the modern Socialist movement has nothing in common with the Utopias of Plato, Campanella, and More, or with the prehistoric tribal institutions, early Christian practises, or the various sectarian communities of the Middle Ages.

The political Socialist movement of our days is primarily a movement of the working class, and has for its object the reconstruction of the present-day system of industry on the basis of collective ownership of the tools of production.

The movement thus presupposes the existence of a competitive individualist system of industry and of a wage-earning class. In other words, modern socialism is unthinkable without its antithesis—capitalism. Socialism is the child of the modern or "capitalist" system of production. And more than that, it is the product of that sys-

tem at a certain advanced stage. The Socialist movement is a protest against the present industrial system, hence it presupposes a state of development of that system to a point where it has become oppressive; it involves a criticism of the system, hence it implies a dissatisfaction with it, and finally it offers a substitute for the present system, hence it is predicated on the assumption of a state of senility of the capitalist régime.

Thus, while the beginnings of the present industrial system may be traced back to the fifteenth or sixteenth century of our era, the modern Socialist movement is barely more than a century old.

Socialism, like most other social theories and movements, has passed through several stages of development before it reached its modern aspect.

In its first phases it was primarily a humanitarian movement, and its political rôle was but secondary and incidental.

The early Socialists saw only the evils of the new system of production, but did not penetrate into its historical significance and tendencies. The evils of the system appeared to them as arbitrary deviations from the "eternal principles" of "natural law," justice, and reason, and the social system itself as a clumsy and malicious contrivance of the dominant powers in society.

To the "unreasonable" and "unjust" social systems of their times they opposed more or less fantastic schemes of social organization of their own invention supposed to be free from the abuses of modern civilization, and thereupon they appealed to humanity at large to test those schemes.

One of the fruits of these theories was the organization of the numerous communistic societies in the early part of the last century.

Another practical application of the utopian Socialist philosophy is to be found in the conspiratory revolutionary societies which accompanied the Socialist agitation of several European countries, notably France, in the thirties and forties of the nineteenth century.

The first gleams of Socialist philosophy appear in the works of the prerevolutionary French philosophers of the school of the "Encyclopedists," notably in those of Jean Jacques Rousseau, who as early as 1754 denounced private property as the cause of all crimes.

But a much more definite and elaborate expression of the Utopian Socialist creed we find in the two works of Morelly, "*Naufrage des îles flottantes* ou *La Basiliade*" (The Shipwreck of the Floating Islands or Basiliade), 1753, and "*Code de la Nature*" (Code of Nature), 1755. The first is a Utopian novel in metric form, and the latter is a philosophic essay. Morelly is a keen and far-seeing critic of the industrial system of individualist competition, and advocates a somewhat loose form of communism.

Next to Morelly, Gabriel Mably (1709-85) must be mentioned among the early French Socialist writers. Like Morelly, Mably advocated a social system based on the community of property, with the difference, however, that the State of Mably is highly centralized, both in the system of production and distribution.

A more realistic note in the literature of the young Socialist speculation is introduced by the French lawyer, François Boissel (1728-1807), whose "*Catechisme du genre humain*" (Cate-

chism of Mankind), which appeared in 1789, the year of the French Revolution, contains the first attempt at a scientific analysis of the modern mode of production.

The first direct step toward an active revolutionary and Socialist movement was made by François Noel Babeuf (1760-96). Babeuf, himself an active factor in the great French Revolution, was by no means satisfied with its accomplishments. "The Revolution," he argued, "has proclaimed liberty, fraternity, and equality,

but equality is a mere sham unless it is social and economic as well as political." With the aim of capturing the government of France and establishing social and economic equality, he organized the famous

Conspiracy of Equals. The movement is said to have attained considerable dimensions in Paris when it was detected in 1796, and Babeuf convicted on the charge of treason and beheaded. Years later, Filippo Buonarroti, a friend and disciple of Babeuf, published the history of the conspiracy and the program of the conspirators, and the work played a large part in the movement of the secret Socialist societies of later years.

Babeuf was the last representative of the eighteenth-century socialism. The beginning of the nineteenth century produced a series of Socialist thinkers and workers who have influenced the shaping of the present-day Socialist movement more directly than their predecessors.

Of these, two are always mentioned together—Charles Henri Saint-Simon and Charles Fourier.

Saint-Simon is a teacher rather than a practical social reformer. The keynote to his philosophy is the demand that society be organized not on a political but on an industrial basis. His last work, "*Nouveau Christianisme*" (New Christianity), is the most complete exposition of his social views, and contains the germs of the theory of economic determinism, which in the hands of Karl Marx has subsequently become one of the most powerful weapons in the arsenal of contemporary Socialist philosophy.

After the death of Saint-Simon his work was continued by a talented coterie of his disciples, prominent among whom were Olinde Rodrigue (1794-1851), Barthelémy P. Enfantin (1796-1864), Amand Bazard (1791-1832), Auguste Comte, the father of positive philosophy, and Ferdinand de Lesseps, of the Suez Canal fame. The Saint-Simonian school at one time gained considerable influence in the intellectual circles of France; its organ, the *Globe*, had a large circulation, and in the Revolution of 1830 the Saint-Simonians played a not unimportant part. But the movement ultimately split, principally on the question of woman's rights.

If Saint-Simon was the preacher of order and system, Fourier may be called the apostle of harmony.

God created the entire universe on a harmonious plan, reasons Fourier, hence there must be harmony between everything in existence.

Saint-Simon emphasizes the rights and importance of society, Fourier dwells principally on the rights of the individual citizens as against organized society. The two great Utopians may be said to be the prototypes of the two dominant tendencies in the Socialist and social theories of our times—collectivism and individualism.

Chief among the French disciples of Fourier is

Victor Considerant, under whose leadership the Fourierist movement attained some importance years after the master's death.

Cabet's Utopian novel "Voyage en Icarie" (Voyage to Icaria), published in 1842, gave rise to a popular movement in favor of communism, which at one time was said to number several hundred thousands of adherents. The movement resulted in the establishment of the "Icarian communities" in the U. S. The first of these communities was established in Texas in 1848, and the last of the series perished in California almost half a century later.

Louis Blanc, who first achieved fame through his work "Organization du Travail" (Organization of Labor), published in 1840, played an important part in the French Revolution of 1848 as a member of the Provisional Committee.

Lamenais is the father of Christian socialism in France. He early advocated the union of the Catholic Church with the growing Socialist movement of the working men. His views were condemned by Pope Gregory XVI., and Lamenais thereafter address his appeals directly to the people. His "Paroles d'un Croyant" (Words of a Believer), published in 1834, contains a burning indictment of the selfish rich, and is full of tender sympathy for the disinherited of the world. It was widely read by the working men of his generation, and made a deep and lasting impression on his countrymen.

Proudhon, the author of the famous "Qu'est ce que la propriété?" (What is Property?) and "Contradictions Économiques" (Economic Contradictions), may be said to be the father of modern "communistic anarchism."

This review of early French socialism would not be complete without a brief reference to the secret societies which made their appearance immediately after the Revolution of 1830, and continued with varying degree of strength and success for about ten years. The principal organizations of that cycle are the *Société des Amis du Peuple* (Society of the Friends of the People), *Société des droits de l'homme* (Society of Human Rights), *Société des familles* (Society of Families), and *Société des saisons* (Society of Seasons), and the most prominent leaders of the movement were Louis Blanqui (1805-81), Armand Barbès (1809-70), Voyer d'Argenson (1771-1842), and Filippo Buonarrotti, mentioned above.

While the socialism of France during the first half of the last century was thus replete with various movements, schools, and thinkers, the movement in England during the corresponding period is practically represented by one name—Robert Owen.

The socialism of Owen differed from that of his French contemporaries just as much as the political and industrial conditions and national temperament and genius of England differed from those of France.

Owen's early activity in the field of social reform was more of a philanthropic than revolutionary character: it consisted in the long and patient work of improving the conditions of his own employees in the Scotch manufacturing village of New Lanark, and in this he succeeded so well that within one generation (from 1800 to 1824) the former miserable village, with a degenerate and wretched population, had become a model community of healthy, industrious, and happy men and women.

His revolutionary career may be said to date from 1817, when, upon the invitation of the "Committee of the Association for the Relief of the Manufacturing and Laboring Poor," he unfolded his views on the causes of poverty and the needed social reforms. The gist of his views is that wide-spread pauperism and popular misery are inseparable from an industrial system based on free competition, and that under such a system the increased productivity of labor inevitably leads to the deterioration of the condition of the working class.

He was a great believer in the influence of environment on the formation of human character, and predicted that improved material conditions of the laboring population would result in the physical, intellectual, and moral regeneration of the masses.

His activities as a Socialist propagandist and experimenter extend over forty years, and are as variegated as intense.

Owen's influence was, however, mainly personal; he left no school or movement behind him.

In Germany the first manifestations of Socialist thought and activity are connected with the names of the celebrated philosopher, Johann Gottlieb Fichte (1762-1814), who in his "Geschlossener Handelsstaat" (Closed Trading State) advocates the State regulation of production and distribution of goods, and the tailor, Wilhelm Weitling (1808-71), who may be considered the connecting link between present-day socialism and its earlier forms.

Weitling seems to have imbibed the theories of French communism in his early traveling days, but he instilled in them the life and faith of the active propagandist and enthusiastic apostle. Like Owen he extended his activity to all spheres

Beginnings in Germany

of radical social reform known in his day, organizing cooperative enterprises, working men's study clubs, a communistic settlement, trade-union organizations, etc. His main theoretical works are: "Die Welt wie sie ist und sein sollte" (The World as it is and as It Should Be), 1838; "Die Garantien der Harmonie und Freiheit" (The Guaranties of Harmony and Freedom), 1842, and "Das Evangelium des Armen Sünders" (Evangel of a Poor Sinner), 1846.

Weitling is the first Socialist to make a more direct appeal to the working class, altho the modern Socialist conception of class struggle is still foreign to him. Weitling's fields of activity were Switzerland and the U. S., but his influence also extended to Germany, Austria, and the colonies of German emigrants in other countries.

In the mean time the industrial development of Europe had proceeded with giant strides, and with it also the scientific study of the character and tendencies of the existing industrial régime. The fantastic theories and hypotheses of early socialism, like those of so many other young sciences, had to be strongly modified if not entirely discarded. Socialism had to be given a new, more realistic, and sound foundation, and this task was accomplished toward the middle of the last century by the twin fathers of modern socialism, Karl Marx (1818-83) and Frederick Engels (1820-95).

The socialism of the new school, known as Marxian or scientific socialism, proceeds on the theory that the social and political structure of society at any given time and place is not the

Owenite
Period

result of the free and arbitrary choice of men, but the logical outcome of a definite process of historical development, and that the underlying structure of such foundation is at all times the economic system upon which society is organized.

As a logical sequence from these views it follows that a form of society cannot be changed at any given time unless the economic development has made it ripe for the change, and that the future of mankind must be looked for, not in the ingenious schemes of inventive social philosophers, but in the tendencies of economic development.

The Marxian Socialists base their hopes on the tendency of modern industries toward centralization and socialization, the inadequacy and wastefulness of the individual and competitive system of production, and the growing revolt of the working classes against the iniquities and hardships involved in that system.

Modern Socialists address themselves not so much to the humane sentiments of society at large as to the self-interests of the working class, as a class primarily concerned in the impending social change. They do not indulge in miniature social experiments or in political conspiracies, but direct their efforts toward the education and political and industrial organization of the working class, so as to enable that class to steer the ship of state from individualism into collectivism, when the time is ripe for it, and to hasten that time.

This phase of the Socialist movement may be said to date from the publication of the celebrated "Communist Manifesto." The "Manifesto" is a brief pamphlet written conjointly by Marx and Engels; it has since been translated into almost all modern languages, and has remained to this day the classical exposition of modern evolutionary socialism.

The "Communist Manifesto" appeared in 1848. The great revolutionary movement of that year, and the long period of European reaction following upon its defeat, temporarily paralyzed the young Socialist movement inaugurated by Marx and his comrades. For almost fifteen years the movement was confined to a few scattered circles of "intellectuals" in the different countries of Europe without penetrating into the masses anywhere. The general political and social awakening which marks the beginning of the sixties of the last century in all principal countries of Europe and in the U. S. of America did not pass without affecting the working classes. A strong labor movement grew up in the most advanced countries of Europe, and a large portion of it fell under the spiritual leadership of the Socialists.

The first fruit of these renewed Socialist and labor activities was the organization of the International Working Men's Association (commonly styled The International) in 1864.

The International was organized in London by some representative English trade-unionist in conjunction with a number of political refugees of various nationalities with whom the capital of England was fairly teeming just then. Its constitution and declaration of principles were drafted by Karl Marx, and the latter instrument was a concise exposition of the Socialist philosophy winding up with the declaration—"No rights without duties; no duties without rights."

The International extended over England, France, Germany, Austria, Belgium, Holland, Denmark, Spain, Portugal, Italy, Switzerland, Poland, Australia, and the U. S. of America, and at one time was considered a great power in European politics. Its active career embraced a period of about eight years, from 1864 to 1872, during which time it held six conventions. These conventions were largely devoted to the discussion of social and labor problems, and served to impress the Socialist movement of the world with a uniform and harmonious character.

The dissolution of the organization was brought about by a number of factors, not the least of which was the fate of the Paris Commune.

The Commune, proclaimed in Paris on March 18, 1871, in its inception had no connection whatever with the International or the Socialist agitation of the time. Its name was not intended to imply any sympathy with the doctrines of communism; it was merely meant to signify the communal or municipal autonomy of Paris. The proclamation of the Commune was a result of the revolt of the Parisians against the excessive centralization of government in France.

But the deciding blow to the life of the International was dealt by the growing spirit of anarchism within its ranks.

Up to about 1869 the International was under the undisputed control of the Marxian wing of socialism, but in the later years of its existence the school of individual anarchism steadily gained ground in the councils of the society under the leadership of the apostle of the new creed, Michael Bakounin (1814-76).

Anarchism threatened to become a power in the International, and Marx and his friends decided to avert the danger by sacrificing the organization. In 1872 the seat of its General Council was transferred to New York, and three years later the International was formally dissolved.

The International, however, had fully accomplished its purpose, and during its activity the Socialist movement of Europe had developed to such dimensions that it became impossible to confine it within the bounds of one central organization. Hereafter we will have to follow the varying fortunes of the movement in the different countries coming under its sway.

Chief among such countries is, of course,

GERMANY

In Germany the present-day Socialist movement runs in an unbroken chain from the days of the agitation of Ferdinand Lassalle (1825-64). Of extraordinary eloquence, profound learning, and indomitable energy, Lassalle was probably the most powerful popular tribune produced by the nineteenth century.

His active work in the cause of socialism is practically confined to the last two years of his life. But during that short period he succeeded in thoroughly rousing the phlegmatic working class of his country by his ringing speeches and powerful writings. In his social views he was a disciple of Marx, but the principal issues of his agitation were the demands for universal suffrage and the establishment of cooperative workshops with State credit.

In 1863 he organized the General German Working Men's Association, which at the time of its founder's death numbered only 4,610 members,

but grew considerably in later years, notwithstanding one serious schism within its ranks.

In the meanwhile a new Socialist party, more strictly Marxian, was organized in 1869 under the leadership of Wilhelm Liebknecht and August Bebel, and the six years following are marked by a bitter feud between the rival organizations. The feud was terminated in 1875 by the amalgamation of all Socialist organizations at the Gotha Convention; the present Social Democratic Party of Germany was thus born. Since then the progress of the Socialist movement has been rapid and steady. Even the period of the most unrelenting government persecution inaugurated by the Exceptional Laws did not succeed in checking its growth. These laws were designed to suppress all forms of Socialist propaganda, and their enforcement was attended by the imprisonment and exile of large numbers of the most active Socialists. They were enacted in 1878 after two successive attempts by irresponsible individuals on the life of the emperor, and were abandoned in 1890 after their utter futility had been demonstrated in practise. The growth of socialism in Germany can be best seen by studying the steady growth of the Socialist vote in the empire.

| ELECTION IN | Social Democratic votes | Percentage of votes, total | Elected to the Reichstag |
|-------------|-------------------------|----------------------------|--------------------------|
| 1871..... | 124,655 | 3. | 2 |
| 1874..... | 351,952 | 6.8 | 9 |
| 1877..... | 493,288 | 9.1 | 12 |
| 1878..... | 437,158 | 7.6 | 9 |
| 1881..... | 311,961 | 6.1 | 12 |
| 1884..... | 549,990 | 9.7 | 24 |
| 1887..... | 763,128 | 10.1 | 11 |
| 1890..... | 1,427,298 | 19.7 | 35 |
| 1893..... | 1,876,738 | 23.3 | 44 |
| 1896..... | 2,007,076 | ... | 57 |
| 1903..... | 3,008,000 | 24.0 | 81 |
| 1907..... | 3,258,968 | 24.3 | 43 |

This table is the best answer to the statement sometimes made that the Socialist Party in Germany lost ground in 1907. It did not lose ground because, in spite of an unprecedented opposition, it increased its vote. It lost seats in the Reichstag not because of weakened strength, but because the elections of 1903 showed the Social Democratic Party to be so strong that in this election the various groups of the Bourgeoisie and Liberal parties largely combined against it. They put forth every effort, led by the government itself. After the election of 1903, a *Reichsverband* (Imperial Union) was formed, the one purpose of which was to work in every way to unite the Bourgeoisie and defeat socialism. The union aided Conservatives here and Liberals there in any way that would mean the defeat of a Socialist candidate. It sent out false statements against socialism and had them published in over 1,000 journals. After the election it reported that it had distributed 10,149,330 pamphlets against socialism. It sent speakers and lecturers into every possible social or literary club. It raised the cry of patriotism, declaring that Germany was attacked. It raised large sums of money from the capitalists and spent it for the election. It roused the small country proprietors who, in Eastern Prussia and the less enlightened districts, terrified the peasants into voting against socialism. The so-called Christian Unions (Evangelical) and the Roman Catholic, so called, Christian Social-

ists voted against the party. Not a stone was left unturned. As the result thirty-eight Socialist seats were captured by combinations against them. Yet in spite of all this the party increased its vote by a quarter of a million. The real strength of the party was never more shown. It was said in the *Antisozialistische Correspondenz* after the election: "The working classes have stood by and will stand by the Social Democratic Party. . . . The party is now more than ever a class party, the revolutionary party of the proletariat, and from the point of view of the proletariat and the revolutionary, the party in this political baptism of fire has now received revolutionary power, while in the election of 1903 it only stood for a certain movement toward democracy."

It should be remembered, too, that by the constitution of the German Empire, in the union of the various German states, the representation in the Reichstag is so arranged that some of the states and districts with comparatively small populations have very much more representation than others. Particularly have the great cities where the Social Democracy has its strength but small representation in proportion to their population. This largely reduces the Socialist representation in the Reichstag. If each vote counted alike the Social Democrats would have elected not 43 but 116 representatives. They cast 3,258,968 votes and only seated 43 representatives, 73 less than they were entitled to, while the Center (Roman Catholic) cast 2,183,384 votes but seated 108 representatives (30 more than they were entitled to), the Conservatives 1,070,658 votes, seating 60 representatives (22 more than they were entitled to). The Socialist press in Germany is very strong. There are 79 Socialist political organs. The *Vorwärts*, of Berlin, has a circulation of 112,000; the *Hamburger Echo* has 40,000; the *Volkszeitung*, 30,000. There are two comic weeklies and one scientific weekly.

The party is thoroughly united, tho allowing of some differences of opinion. Of late years Edouard Bernstein has led a wing of the party advocating a less doctrinaire and more opportunist policy than his critics in the party; yet it has not produced the split that the enemies of the party predicted; the wise leaders of the party have allowed differences of opinion and yet held the party as a unit in action for whatever view the majority held.

Industrially the party works in the trade-unions, which are said to have gained 913,000 new members in Germany since 1905. In every way the party holds the working classes. The number elected as councilors in German communes is over 2,000.

AUSTRIA

The Socialist movement in Austria is closely linked with that of Germany, so much so that in their earlier stages the two movements were hardly differentiated. In the famous Convention of Eisenach, held in 1868, the Austrian Socialists were represented as well as their German comrades. But notwithstanding the common beginnings and intellectual identity of socialism in both countries, the movement in Austria soon fell behind that of Germany. There were many reasons for this phenomenon, chief among them being the industrial backwardness of Austria, and the difficulty of carrying on a systematic and uni-

form propaganda of socialism among the many heterogeneous nationalities constituting the Austrian Empire.

The beginnings of the Socialist movement in Austria appear in 1867, when the Imperial Council granted a partial right of assembly and association to the people of Austria. Two years later the movement was strong enough to force the government to revoke its ban against Socialist propaganda by a most remarkable and unexpected demonstration on the streets of Vienna (Dec. 13, 1869). The succeeding period (1870-1888) is principally noteworthy for the internal dissensions within the movement. The practical disfranchisement of the working class and the brutal government persecution had bred among the more radical working men a spirit of embittered pessimism which made them unusually susceptible to the propaganda of anarchism, then in its prime all over Europe, and the main work of Austrian Social Democracy during that period was to combat the anarchist movement. The turning-point of the Socialist movement in Austria may be considered the Hainsfeld Congress (1888) which marked the final victory of Social Democracy over anarchism in the Austrian labor movement, and created a unified and well-organized party which has since been making rapid and steady progress. Its efforts recently have been mainly directed toward attaining universal suffrage by steady agitation, monster demonstrations, till at last the government has been compelled to yield, and in the parliamentary elections of 1907, for the first time held on the basis of universal suffrage, the Social Democratic Party polled over 1,000,000 votes, electing no less than eighty-seven deputies to the Reichsrat.

Austria has an extensive Socialist press—2 dailies, of which the *Arbeiter Zeitung*, of Vienna, is the most important; 24 periodical journals, and 36 trade-union papers. Besides these Bohemia has 2 dailies, 15 periodical organs, and 19 trade-union journals. Austria in 1904 reported 526 Socialists elected communal councilors. Bohemia in 1907 reported no less than 1,953 local unions with 130,000 members connected with the Socialist Party.

GREAT BRITAIN

Notwithstanding the fact that England is the most industrial country of Europe, its Socialist movement has been rather tardy in appearing and in growth.

The organized Socialist movement of England may be dated from the formation of the Democratic Federation in 1881. The federation, called into life by H. M. Hyndman, Herbert Burrows, and a few other well-known Socialists, was originally not of outspoken Socialist views, but became so in 1883, when it was reorganized under the name of Social Democratic Federation. The federation has ever since continued a somewhat uneventful existence, and is to-day the orthodox representative of Marxian socialism in England. It has now two members of Parliament, and about 100 in various municipal or county councils and boards. Its organ is *Justice*.

In 1893, however, another political party of socialism was founded principally through the efforts of Keir Hardie. The organization assumed the name of the Independent Labor Party, adopted a somewhat broader platform than the Social Democratic Federation, and laid more

stress on the political side of the movement. But contrary to the expectations of its founders, it did not acquire a larger influence among the working classes of England than the older organization, and works to-day with the newly formed Labor Party. (See below.)

Besides these two parties, the Socialist movement of England is also represented by the well-known Fabian Society, founded in 1883, principally for the purpose of educational propaganda along Socialist lines. The society has published a large number of tracts on the main aspects of theoretical socialism and has achieved considerable success in the field of municipal reform, and in influencing the middle classes. The outspoken Socialist organizations in England have been, till recently, a factor of but mediocre importance in the social and political life of the country, but it would be a mistake to measure the strength of the Socialist movement in England only by its organized portions.

(The Socialist movement in England largely expresses itself in the radical or "new" trade-unions, many of which are avowedly socialist in their views.) The formation of the Labor Representative Committee, which has recently elected twenty-nine members to Parliament, and has taken the name of "The Labor Party," is principally the work of these unions aided by the Socialist organizations, and it is the masses behind that committee which to-day must be considered as the main factor of English socialism and as the nucleus of a larger and more influential Socialist movement in England.

Not only has the English labor movement 29 representatives to Parliament, but some 800 members of town, county, urban, or rural councils and boards of guardians, etc. The distinctively Socialist press of Great Britain is not large, consisting of only 12 papers, representing the different movements; but there are besides 16 local labor papers and 25 trade-union journals; and socialism is discussed largely in many other English papers, and not seldom at least partially favorably.

FRANCE

If the Socialist movement of Germany may be considered a model of orderly and methodic growth, that of France has, on the contrary, a most bewildering and stormy career.

With the fall of the Paris Commune the movement in France received a blow from which it recovered but very slowly. For a number of years after 1871 the only manifestation of Socialist activity was to be found in the students' circles organized by Gabriel Deville and Jules Guéde, and the main efforts of these circles were directed toward the propaganda of socialism among the trade-unions. In these efforts they gained a partial success in 1878, when the general trade-union congress of Lyons pledged its support to some socialist candidates, and several large trade organizations indorsed the entire Socialist program. The arrest of Guéde and thirty-three other labor leaders in 1879 for participation in a political labor conference, and the brilliant defense of Guéde on that occasion, largely served to increase the sympathies of the working population for socialism, and the general trade-union congress of Marseilles held in the same year unreservedly declared itself in favor of the movement.

But this declaration made by the delegates

under the influence of the events immediately preceding the convention did not seem to have the unanimous support of their constituents. At the following convention held in Havre in 1880 the discussion was resumed, and resulted in a split. The organized working men divided themselves into two separate organizations distinguished from each other as "collectivists" and "cooperativists" respectively. And the Socialist movement in France has ever thereafter progressed through a process of alternate fusions and divisions. The first schism in the ranks of the Socialist movement proper took place in 1882, when the strict adherents of Marxian socialism led by Jules Guéde, Paul Lafargue, and Gabriel Deville separated from the "Possibilist" or opportunist Socialists headed by Paul Brousse and Benoît Malon. The former organized the *Parti Ouvrier* (Labor Party), and the latter the *Fédération Française des Travailleurs Socialistes Révolutionnaires* (French Federation of Socialist Revolutionary Working Men). To these must be added the *Parti Révolutionnaire*, founded by the veteran of the French Revolution, Blanqui, upon his release from the last term of imprisonment in 1879, and after his death directed by the well-known communard, Edouard Vaillant.

The number of Socialist parties was further augmented by a split within the ranks of the "Possibilists," the more radical wing of which organized an independent party in 1891 under the name of *Parti Ouvrier Révolutionnaire Socialiste*, and under the leadership of Allemane, and also by the formation of numerous local groups of "Independent Socialists" whose membership included such prominent Socialists as Étienne Millerand and Jean Jaures.

The period between 1898-1901 is marked by efforts to bring about the union of Socialist forces. These efforts were partly realized in 1900, when a national congress of all French Socialist parties and organizations was held in Paris. But in the meanwhile a new issue presented itself to the Socialists of France. The events attending the Dreyfus agitation had forced socialism to the front of national politics, and one Independent Socialist, Étienne Millerand, was given a portfolio in the cabinet of the new premier, Waldeck-Rousseau. Millerand's entry in the "bourgeois" cabinet had the approval of the more liberal or "opportunist" wing of the Socialist movement under the leadership of the eloquent Jaures, but was strongly condemned by the more orthodox faction headed by Jules Guéde. And on this new issue the Socialist organizations of France now grouped themselves. The "ministerialists" combined into the *Parti Socialist Français* while the "antiministerialists" united into the *Parti Socialiste de France*. Both parties continued a separate tho not always antagonistic existence until 1905, when they united into one party largely through the good services of the International Socialist Congress held in Amsterdam in 1904. The new party is the first in France to bring together all of the more important Socialist organizations under one administration, altho a number of minor groups of "independent" Socialists still remain in existence.

This united party, taking the name of *Le Parti Socialiste*, is organized on the following basis (we quote only its most essential points):

1. The Socialist Party is a class party which aims at socializing the means of production and exchange; that is, of transforming the capitalistic organization of society into

a collectivist or communal organization. Its means to this end is the industrial and political organization of the proletariat (the working classes). By its aim, its ideals, the means which it adopts, the Socialist Party, while working for the immediate reforms demanded by the working classes, is not a party of reform but a party of the class struggle and of revolution.

2. The parliamentary representatives of the party form a distinct group, opposed to all the political parties and groups of the *bourgeoisie* (middle classes). The Socialist group in Parliament must refuse the government all the means which continue the domination of the *bourgeoisie* and its maintenance in power; it must therefore refuse military appropriations, appropriations for colonial conquest, secret funds, and must not accept the budget as a whole.

Even in exceptional circumstances the representatives of the party cannot speak for the party without its consent. . . . While full liberty of discussion is given to the Socialist press, as to both doctrine and method, when it comes to action they must conform to the decisions of the Congress, interpreted by the Central Committee of the party.

Upon this basis the party is attaining solidification. It has groups in 80 out of 87 departments, organized in 70 federations. It has elected 60 general and 51 district councilors, 149 mayors, 219 assistants, and 2,160 municipal councilors. It has elected 52 deputies out of 584. Its central organ is the *Socialiste*, a Paris weekly. The press of the party besides includes 2 dailies, 4 semiweeklies, 37 weeklies, and 2 monthlies. The steady growth of French socialism is, however, best seen in the growth of the French Socialist vote.

The first Socialist campaign in parliamentary elections was made in 1885, when the combined Socialist parties polled about 30,000 votes. The successive growth of the vote is shown by the following round figures:

| | |
|-----------|-----------|
| 1887..... | 47,000 |
| 1889..... | 120,000 |
| 1893..... | 240,000 |
| 1898..... | 700,000 |
| 1902..... | 805,000 |
| 1906..... | 1,000,000 |

ITALY

The Socialist movement in Italy antedates the International, and when the latter split between the adherents of Karl Marx and Michael Bakunin, the Socialists of Italy, like those of almost all southern and economically backward countries, sided with Bakunin.)

The first manifestation of Socialist political activity occurred in 1882, when several scattered Socialist groups united for the ensuing parliamentary elections and nominated candidates. The elections gave to the Socialist candidates about 50,000 votes, or 4 per cent of the total vote cast, and secured the return of two of them to Parliament. Encouraged by this success, the Socialists of Italy organized a national Socialist Party in 1885, but the party made but little progress, and between government persecutions and internal dissensions, it led a very precarious existence.

It was only in 1892 when a Socialist Party after the general European model was organized in Italy, and since that time the Socialist movement in Italy has made large and steady gains. In 1903 the party consisted of over 1,200 local groups with a total dues-paying membership of over 42,000; it had 32 representatives in the Chamber of Deputies, and had control of about 100 municipalities, besides having representatives in almost all other of the most important cities and towns of the kingdom. One of the most remarkable features of the Socialist movement in Italy is its strength among the rural popula-

tion of the country, principally the farm-laborers. The membership of the Socialist Party is largely made up of them, and the Socialist Party also took the initiative of organizing these laborers into an independent national organization. In 1900 that organization numbered over 200,000 members. The organized Socialist movement of Italy is divided into several camps on questions of policy and methods, but that does not seem to interfere with its work or progress.

The course of the party, however, has been somewhat tempestuous. Strikes have been numerous, wide-spread, and heated. There is a strong party press—5 dailies, of which *Avanti*, published at Rome, and edited by Enrico Ferri, is the party organ; 65 weeklies, and 23 trade-union journals. Many Socialist communal councilors have been elected, and in over 100 communes they have the majority.

BELGIUM

It was from Brussels that Marx and Engels issued their "Manifesto" of 1848, and in Belgium the International early took root, but the split of the International in 1872 divided the local movement into two hostile camps, the Marxists and Bakuninists, or Social Democrats and Anarchists, and in this division the movement finally disappeared, so far as that phase was concerned.

The first distinctly Socialist political organization was founded in 1885 under the name of the Socialist Labor Party of Belgium. Notwithstanding the frequent dissensions and heated disputes between the Belgian Socialists, the movement has made rapid progress. In 1903 the party undertook a general agitation for universal suffrage (Belgium still having a plural vote seriously discriminating against the working classes). This, however, did not succeed, and in 1904 the party vote was reduced to 463,967 and its representatives in the Chamber of Deputies reduced to 28. In 1906, however, the vote was 469,094 with 30 representatives. The party besides has elected 7 senators, 91 provincial councilors, 650 councilors in 193 communes, and holds the majority in 22 communes. The party press includes 11 dailies, 20 weeklies, 7 monthlies, and 18 Socialist trade-union journals. The leading weekly is *Le Peuple* of Brussels. The party has also connected with it 252 trade-unions, 229 political societies, 25 artistic, and 180 mutual.

The activity of the Belgian Socialists is principally marked by their repeated and embittered struggles for universal suffrage, as above stated, and by their successful organization of cooperative enterprises. Of these there were in 1903 no less than 1,200 establishments with a membership variously estimated at 130,000 to 200,000, and their combined annual business amounted to 40,000,000 francs. The most important of these cooperatives are the "Vooruit," established in Ghent in 1880, and the "Maison du Peuple," founded in Brussels in 1884.

HOLLAND

The movement in Holland, as in Belgium, began with the International, but developed a still stronger anarchistic tendency, and one from which it more slowly freed itself.

The first political organization of socialism in Holland was the Social Democratic Union, founded in 1878, but it made but little progress until

1893, when the anarchistic elements under the leadership of the eloquent Domela Nieuvenhuis withdrew from it. Since then the party has grown, tho not rapidly. It had in 1906 167 sections with 7,471 members, and cast in 1905 65,743 votes, electing 7 deputies. It is represented also in 30 communal councils. The party press has 1 daily, the *Het Volk*, of Amsterdam, and 7 weeklies. Trade-unionism in Holland also long suffered from its connection with anarchism, but in 1905 a federation of Dutch trade-unions was formed, which is now composed of 18 national organizations, with about 28,400 members, and which works sympathetically with the Social Democratic Party.

THE SCANDINAVIAN COUNTRIES

The Socialist history of Denmark, Sweden, and Norway may be reviewed together. The movement in Denmark is the oldest. It dates back to the days of the International (1870-72), but the present Socialist organization of the country, the Social Democratic Union, was founded in 1878. In 1889 the Danish Socialists elected one deputy to the *Folkething* (Parliament), out of a total of 114; in 1903 the number of their representatives rose to 16, and in 1906 to 24. The Socialist vote was 77,000; 4 representatives were also elected to the *Landsting* (Senate). The party has no less than 25 daily papers and 2 weeklies, the leading daily being the *Socialde Demokrater*. In municipal politics the Socialists have elected over 400 municipal councilors in different cities and towns.

The movement in Sweden was initiated under Danish influence in 1881, and grouped itself around three Socialist papers, the *Social Demokrat*, published in Stockholm since 1885; the *Arbetet* (Worker), established in Malmo in 1887, and the *Ny Tid* (New Times), founded in Gothenburg in 1889. As in the case of Belgium and Holland, the main activity of the Socialist Party has been for years directed toward the conquest of universal suffrage, and its campaign in that behalf was as picturesque as it was energetic and effective. The party has now elected 15 members to the Second Chamber out of 230. It cast in 1905 30,000 votes.

The Socialist organization of Norway, the Norwegian Labor Party, was organized in 1887, but it constituted itself as a Socialist political party only two years later. In the elections to the Storting in 1906 the party polled about 45,000 votes and elected 10 deputies; it also has about 330 representatives in the various municipal councils, a number of them being women. The party press includes 4 dailies (the *Social-Demokraten*, of Christiania, the most important), 9 others, two or more times a week, 2 weeklies, and 3 reviews.

The 25,308 members of the united labor-unions of Norway also support the Labor Party. Indeed, the distinguishing feature of the Socialist movement in the three Scandinavian countries is its complete fusion and unity with the trade-union organizations. In fact the organized working men of each of these countries up to a very few years ago constituted but one party, operating simultaneously or alternately on the economic and political fields. The types and methods of the Socialist movement in the three countries are similar to such a point that joint conferences or conventions of the Socialists of Denmark, Sweden, and Norway are quite frequent.

RUSSIA

While the modern Socialist movement in Germany and France, as well as in all other European countries, is primarily economic in its character, and is supported principally by the industrial working classes, the movement in Russia was in its inception preponderatingly political and ethical, and was represented principally by men and women of the better situated and cultured classes. This difference in the character of the movement is accounted for by the difference between the social and economic conditions of that country and the rest of Europe at the period of the birth of socialism in Russia. At a time when the modern industrial régime was fully developed, and the system of representative government firmly established in all principal countries of Europe, Russia was a purely agricultural country with a population of peasants just liberated from serfdom, with no manufacturing class or industrial proletariat worth mentioning, and with an almost Asiatic form of autocratic government. The socialism of Russia was not the direct result of economic development, not a form of class struggle between the classes of capitalists and working men; it was partly an expression of political revolt against absolute czarism, and partly a reflex of the economic Socialist theories with such modifications as the peculiar conditions of Russia comported.

The first expressions of Socialist thought in Russia coincide with the agitation for the emancipation of the serfs, and its best known representatives of that period are a famous coterie of publicists and critics, among whom we must mention Alexander Herzen, an expatriated nobleman of considerable wealth, who conducted an active agitation for Russian freedom from London, principally by means of his magazine, *Kokokol* (Bell), and Nicholas Chernyshevsky, the editor of the influential magazine *Sovremennik* (Contemporary), who was deported to Siberia in the prime of his life, to return thence an old man and a physical and mental wreck.

The next phase of the Socialist movement in Russia is that designated as "Nihilism." The word was coined by the well-known novelist Ivan Turgenev as a term of ridicule of the new current of Russian thought which developed strongly around 1860-70, and whose main characteristics were a crude materialism and the negation of all established beliefs.

"Nihilism" was an intellectual rather than a political or social movement, but its effect was to promote socialism in two ways: it created a negative attitude toward the old order of things in Russia, and it developed a thirst of positive knowledge among the youth of both sexes, driving large numbers of them into the universities of Western Europe, principally those of Switzerland, since they could not quench that intellectual thirst at home. There young and receptive Russian students were powerfully attracted by the awakening Socialist movement of Western Europe, and also came under the influence of their own exiled countrymen, Michael Bakunin, Alexander Herzen, and Peter Lavroff, the foremost Russian representative of scientific socialism at that time. The Socialist sympathies of these Russian students were so manifest that their government finally took alarm, and in 1873 summarily recalled them to their fatherland under pain of exile. The effect of the order was hardly

gratifying to the government; the students returned in large numbers, but they returned as active Socialist propagandists.

At this stage of the movement Russian socialism was perfectly peaceful. The activities of the young propagandists were principally educational: their main effort was to raise the intellectual level of the illiterate peasantry composing the great bulk of the population. They spread in the villages, settled among the peasants, whose habits, language, and even dress they tried to imitate, and conducted the work of Socialist propaganda side by side with that of general education. But their activity provoked severe government reprisals: the "political offenders" were hounded down, executed, imprisoned, or exiled to Siberia frequently without as much as the formality of a trial. Within five years the young movement found itself practically checked: the Socialist propagandists, decimated in numbers and rendered desperate by the relentless and cruel police persecution, abandoned the peaceful methods of propaganda. A seeming accident determined the succeeding phase of Russian socialism.

In 1878 a young woman named Vera Sassulich shot at General Trepoff, the military commandant of St. Petersburg, as an act of revenge for his brutal treatment of a political prisoner. Vera Sassulich was placed on trial for the offense, but was triumphantly acquitted by the jury amid the plaudits of the better part of the population. Encouraged by the success of Sassulich, deprived of all means of peaceful activity, and rendered desperate by the relentless police persecutions, the Socialists turned to methods of force and conspiracy.

A sudden and radical change took place in the Russian revolutionary movement. The old type of peaceful propagandist and dreamer disappeared, and instead of him there arose the sulky and determined terrorist. The Russian Socialists engaged in mortal combat with the autocratic government, and the embodiment of that government, the czar in person. The struggle lasted but a few years, and it was the most unique ever witnessed in history. A mere handful of idealists, without substantial support on the part of any class of the population, was arrayed against the rulers of Russia, supported by a powerful police, a vast army, and unlimited resources, and still the struggle was fierce, just as fierce on the one side as on the other. The "white terror" of the government was fully balanced by the "red terror" of the revolutionists. The enthusiasm, courage, and ingenuity displayed by the Russian Socialists, men and women, during that period, defies comparison. The annals of these few years of the movement are the most romantic in the history of international socialism, and are characterized by numerous political assassinations, and by the imprisonment and execution of the most gifted leaders of Russian socialism. The movement culminated in the assassination of Czar Alexander II., and this triumph of the first period of revolutionary terrorism in Russia was also its end. The Russian revolutionists had expected that the killing of the czar would be the signal for a general revolt, but in this expectation they found themselves sorely disappointed. The population of Russia was not ready for a revolution at that time, and had but little sympathy or understanding for the youthful Socialists.

The "Will of the People," the famous fighting organization of the revolutionary terrorists, survived the assassination of Alexander II. only a few years.

In the meanwhile modern industrial conditions rapidly developed in Russia, and with them developed a new social power, the class of factory workers.

Thus was prepared in Russia the soil for a Socialist movement after the pattern of Western Europe, and the soil rapidly produced a plentiful harvest. Already in the days of revolutionary terrorism a small group of Russian Socialists, headed by George Plekhanoff, Paul Axelrod, and Vera Sassulich, based their hopes for the future of Russian socialism in the nascent class of industrial workers, and their propaganda kept pace with the growth and spread of that class. In the early nineties of the last century official Russia, greatly to its surprise and dismay, found itself confronted in all industrial centers by a well-organized and radical labor movement, which refused to yield to persecution or to be side-tracked by governmental ruses. The organized labor movement gave a new impetus to the political Socialist movement. (The Social Democratic Party, originally organized by Russian political exiles in Switzerland, soon had a number of local committees in various parts of Russia, and was reinforced by the organizations of the Jewish, Polish, Lettish, and Armenian Social Democrats. At the beginning of the present century the Social Democratic Party, secret and persecuted as it was, had developed into a power of no mean proportions, and during the most agitated days of the overt outbreak of the Russian revolution, toward the end of 1905 and the beginning of 1906, it was this party that led the movement.

With the revival of the Socialist movement in Russia, revolutionary terrorism, the natural child of unbridled autocracy, gradually reappeared. This movement was at first represented by a number of scattered groups, but in 1901 the large majority of them combined their forces and created the party of Socialist Revolutionists, which is responsible for the numerous political assassinations preceding and accompanying the present war between the government and the people of Russia. It is impossible at this time to estimate the number of Russian subjects enlisted in the ranks of socialism of one shade or another, but the fact that the Second Duma, elected on a restricted suffrage and under government surveillance, had about 100 Socialist members (Social Democrats, Socialist Revolutionists, and representatives of the "Group of Toil"), is eloquent testimony of the immense spread and power of socialism in Russia. The outcome of this power is best studied as Russian rather than distinctively Socialist history. (See RUSSIAN REVOLUTION.)

In Finland the Socialists cast 330,000 votes and elected 80 out of 200 delegates to the Diet, according to the report made at the International Socialist Congress of 1907.

UNITED STATES

In the early part of the last century the United States were the chief theater of communistic experiments. The disciples of Owen, Fourier, Weitling, and Cabet alike sought the realization of their Utopian ideals on American soil, and during

the decade of 1840 to 1850 Fourierism in America developed great strength, both as an intellectual movement and as a practical experiment. Among its adherents were many persons of national reputation, such as Horace Greeley, Nathaniel Hawthorne, Charles A. Dana, Albert Brisbane, Margaret Fuller, George Ripley, John S. Dwight, and William E. Channing, and among its experiments the famous Brook Farm and the North American Phalanx each lasted a number of years.

But modern political socialism made its first appearance in the U. S. years after the Fourierist and other Utopian Socialist movements had died out, and there seems to be no direct connection whatever between that movement and its early Utopian precursors. (The present Socialist movement in America may be dated from 1868, when the "Social Party of New York and Vicinity" was organized. That party immediately after its formation nominated an independent ticket, but its vote was insignificant, and the organization collapsed. It was succeeded by the "General German Labor Association," which in 1869 became the first local organization or "section" of the "International Working Men's Association." Between 1869 and 1872 a number of additional "sections" of the International were organized in almost all the principal industrial centers from New York to San Francisco. The Socialist movement thus organized seemed so promising that the International transferred its General Council to the U. S.; but after a few years, and especially during the industrial crisis of 1873, the organization rapidly disintegrated.

The first political party on a national scope organized on American soil was the "Social Democratic Working Men's Party," called into life on July 4, 1874, which party, together with several other then existing Socialist organizations, merged into the "Working Men's Party of the U. S." in 1876. It was this party, which had in the meanwhile changed its name to "The Socialist Labor Party of North America," which maintained undisputed hegemony in the Socialist movement during twenty-three years, and was largely instrumental in laying the foundation of the present Socialist movement in this country. In 1892 the Socialists of the U. S. for the first time nominated a presidential ticket, and they have ever since invariably adhered to the policy of independent politics, steadfastly refusing to ally themselves with any other political parties.

But notwithstanding the untiring efforts and persistent propaganda of the Socialist Labor Party, the growth of the Socialist movement in the U. S. was exceedingly slow and easily out of keeping with that of the movement in other countries. (As a matter of fact, the movement was largely confined to foreign working men, principally Germans, and until the end of the last century it did not succeed in acquiring a foothold in the broad masses of the native population. But during the last decade a number of circumstances have combined to insure a more favorable reception to the gospel of socialism in the U. S. The rapid industrial development of the country, accompanied by the growth of gigantic trusts and powerful labor-unions, the growing intensity of the overt struggles between capital and labor, and the collapse of the Populist and other reform movements, all served to prepare the soil for the Socialist seed. Alongside of the Socialist Labor Party, largely built on the narrow lines of a mere propaganda club,

a new party, the "Socialist Party," sprang up, absorbing a considerable part of the members of the Socialist Labor Party, and attracting large numbers of new converts, native Americans of all parts of the country, recruited principally from among the working class. The Socialist Party has at this time (1907) about 1,000 local organizations in the different states and territories of the union, with a dues-paying membership of over 35,000. It polled a vote of almost half a million in the presidential elections of 1904, and its press consists of over thirty periodical publications in almost all conceivable languages. The Socialists have no representation in the U. S. Congress, but they have lately conquered a number of seats in several state legislatures and municipal councils.

OTHER COUNTRIES

Socialism has now made organized appearance in practically every civilized country of the world. In Switzerland socialism, early connected with the International, is now organized on Marxist lines, and has identified with it the *Grütlverein*, the oldest Swiss labor organization, as well as other societies and trade-unions. The party cast in 1906 about 70,000 votes and elected 2 representatives to the National Council, besides 4 others, whom it claims to have elected but who were disqualified. In Spain a Socialist Party is now organized in 100 groups with 6,000 members. It has 7 weeklies, the *Socialista*, of Madrid, being the most important. In Hungary since 1903 the Social Democratic Party has grown from a handful more or less under the ban of the police, to a strong political party which the government cannot ignore. As in Austria, the struggle has been for universal suffrage, and the government, as again in Austria, has been compelled to grant this, tho no elections having yet been held under universal suffrage, the number of Hungarian Socialists cannot be given. The membership in Hungarian trade-unions, which are practically Socialist organizations, has grown from 10,000 at the beginning of 1902 to 129,332 in 1906. Farther east Socialism claims over 3,000 in Bulgaria, mainly of the lower middle class, the proletariat not yet being awakened to it.

In 1902 the party polled 30,000 votes and elected 8 deputies. There are 43 unions with a membership of 1,970. In Serbia a Social Democratic Party is struggling against the government for universal suffrage. In 1906 it had 23 local organizations, 3,133 members, and elected 1 deputy. In Rumania, Greece, and Portugal there are only the beginnings of a movement. Luxemburg, however, has 5 Socialist deputies.

Outside of Europe and the U. S. socialism, too, is spreading. In Australia, as in England, the Labor Party is the main political expression of the working classes; but tho not explicitly Socialist, its program, even more than in England, is socialistic, and a very large number of its leaders and members are avowed Socialists. It has in the Upper Federal Chamber 15 representatives out of 36, and in the Lower Chamber 26 out of 75. In several of the state legislatures they have even more representation. There is, however, also a Social Party organized in Victoria and in New South Wales.

In Canada socialism has not been much developed except in British Columbia, where there

is a Socialist weekly, *The Western Clarion*. Two Socialist candidates were elected in this province in 1903. Toronto in the east cast 8,200 votes.

In South America there are Socialist organizations in the Argentine Republic (35 groups, 5 papers, 1 daily, *La Vanguardia*, and polling in 1906 3,500 votes), in Bolivia (with a paper, *L'Aurora*), in Chile (100 groups, 4 dailies, and several other journals, polling 18,000 in 1906 and electing 6 deputies), and beginnings in other countries.

We have thus briefly surveyed the development and present condition of the Socialist movement in the principal countries of Europe and America. At the International Socialist Congress held in Stuttgart in 1907 no less than 23 distinct nationalities were represented by delegates, some of them coming from the countries of the Balkan, Japan, South Africa, and Australia. The number of Socialist voters all over the world is at present estimated at about 10,000,000, and the number of adherents of the Socialist creed, voters and non-voters, all over the world, is probably no less than 30,000,000. The Socialist movement has representation in the parliaments of fifteen nations, and in the senates of four countries (Belgium, Denmark, France, and Australia).

An important fact of the movement is the formation of juvenile Socialist organizations, reporting 59,225 members in all the principal countries of the world; also a very large and important Socialist movement among the women in these countries, with a growing literature.

MORRIS HILQUITT.

SOCIALISM, OBJECTIONS TO: While it would be absurd to say that the present industrial system will remain forever unchanged, there is reason to think that, in its essential features, it will continue for a long time to come. The vitality of capitalism is habitually underestimated by Socialists, who think of it as a decaying system, whereas it is still full of life and vigor.

The basic principle of business activity is the exchange of commodities and services for one another, the giving of a quid pro quo, so that business life, in spite of the dishonesty connected with it, is essentially ethical, and not a system of legalized robbery and exploitation.

Another of the foundation-stones of capitalism is the principle of egoism, the fact that men work for themselves and their families first of all, and secondarily, if at all, for the good of society. Self-interest is the most powerful of all motives and is the mainspring of industrial activity. And yet, as a rule, a man in business best secures his own good by making himself valuable to society.

Another element of strength in capitalism is the fact that it affords to the industrially capable free scope for their energies, opportunity of advancement, and great material rewards. In spite of the concentration of industry, or because of it, the laborers' chances of promotion are greater than ever before in the history of the world. By a process of economic selection the natural leaders come to the front, while the rank and file of the industrial army are employed most of the time, and are supported in a degree of comfort unknown to the common people of former times, or to those of non-capitalistic countries of the present day.

Strength of Capitalism

Still another strong feature of capitalism is the automatic process of exchange, by which the social value of commodities and the social efficiency of workers are measured. Employers and employees as a rule are paid out of the products of their own industry, and their social efficiency is measured by the profits and wages which they receive. There is thus a mathematical test of efficiency, which is rigorously applied throughout the industrial system, and by which the cost of production is reduced and the product increased, so as to secure a maximum of social utility at a minimum of social cost. Defective as this method of distribution may be, because of imperfect competition, it is more equitable than any artificial system that could be devised, and, tho working hardship to the inefficient, it rewards the efficient, increases the total product of industry, and is good for the majority of the working class.

These and other characteristics make the capitalistic system very strong, but it has the further advantage of possessing the field. It is a working system, which has done great things for the countries that have adopted it, making Western civilization dominant throughout the world, and promising to do as much for Russia, Japan, China, and other non-capitalistic countries, to develop their resources, increase the productivity of their labor, and raise the standard of living.

So the burden of proof rests upon those who would abolish capitalism. They must make it clear that it can be and will be replaced by something radically different and vastly better, or intelligent people will be content to make the best of an imperfect but measurably perfectible system, rather than to commit themselves to a policy of radical experiment and social revolution.

The world is not yet converted to socialism, nor is likely to be for many years to come. The numerical strength of capitalism is very great. Its supporters include manufacturers and merchants, large and small, and it is to be noted that the petty bourgeoisie are not being eliminated as many Socialists contend. Capitalism also commands the adherence of the farmers, with few exceptions; also the vast majority of clerks and officials, the influential professional classes, and the more efficient and highly paid laborers, who have much to lose and nothing to gain by a plunge into democratic collectivism. The proletariat, the propertyless class, who, as Marx says, "have nothing to lose but their chains," are not relatively increasing, nor is their misery increasing, while the new middle class of highly paid workers and professional people is steadily increasing, and forms a bulwark against the realization of socialism.

The laboring class itself, the hope of Socialists, is not united, nor is it likely to unite, upon a program so radical as that of socialism. Probably a majority of those who vote with the Socialists in Germany are not Socialists at all, but republicans, reformers, opportunists, people who protest against monarchism, militarism, and the many evils of capitalism, but who do not look for a social revolution, nor desire the establishment of democratic collectivism. The realization of socialism would not benefit the working class, particularly the more efficient. There would probably be a leveling down, rather than a leveling up, and the laboring class would not be slow to realize the danger of such a process.

The experiments that have been tried in gov-

ernment ownership and management of public utilities have been disappointing, if not discouraging, to the advocates of State socialism. In every country, not excepting Germany, the government official is found to be slow, inefficient, and unprogressive, a slave to routine and red tape, lacking initiative and the stimulus which is necessary to high industrial attainment. The inertia of the public service is notorious, and it is almost an accepted principle that whatever the government does is done in the slowest and most expensive way. The moderate degree of efficiency that is found in public undertakings is largely due to the example of private enterprise, and to the fact that they are managed by people who have been trained in the school of private business. Unless public ownership can show better results in the future than in the past, it is not likely that the people will favor an extension of such activities, even when the government is wholly controlled by the working class.

But in spite of all considerations of prudence, it is possible that the working class in some small country, like Belgium, Switzerland, or New Zealand, may determine to establish collectivism, and thus put their economic theories to a practical test. What would happen in such a case it is impossible to tell.

One may reasonably suppose, however, that production would be carried on by industrial groups, composed of the leading industries with their natural subdivisions. To secure harmony and cooperation it would be necessary to have a governing body at the head of each group, and a central committee representing the industries of the whole nation. There would be a vast and complicated organization, demanding not only faithful industry on the part of the rank and file, but great executive ability and intense application on the part of the officers and the members of the central executive body. But since all the industrial army would be civil servants, working, not chiefly for their own advantage, but for the welfare of society at large; and since it would be necessary to operate by rules, more or less inflexible, with a system of red tape and routine, and, since there would be no scientific measure of industrial efficiency; and since the workers would demand shorter hours and easier conditions in general, there is every reason to think that the working of the system would be characterized by the slow and unprogressive spirit that now marks all governmental undertakings, but to a far greater degree, because of the absence of competition with private enterprise.

There can be little doubt that the cost of production would be greatly increased; that Belgium, for example, would lose her foreign trade to England, Germany, and the United States; that New Zealand would not be able to compete with Australia and the Argentine in the production of mutton; and that all the countries of western Europe, under socialism, would be ruined by the competition of Japan and China.

Realizing the possibility of such an outcome, and recognizing the fact that the capitalistic countries of Europe cannot economically produce their own supply of food and raw materials, many Socialists do not approve of national collectivism. They wish to have international collectivism, and thus forever abolish international competition, as well as competition between private persons within the limits of a given

Results of Socialism

state. This is surely the extreme of Utopianism, ignoring, as it does, all racial prejudice between Europeans, and completely blind to the impracticability of industrial cooperation between the white race on the one hand and Asiatics and Africans on the other. To think, moreover, that the industries of the world can be combined into a single cooperative system on any basis that would be satisfactory to all the nations and all the workers involves a stretch of the imagination and an exercise of faith quite beyond the bounds of mere unaided reason.

Even within the limits of a single socialistic state, the causes of disagreement would be such as to threaten the disruption of the new society from the very first. Socialists generally think of man as tho he were purely a social being, whereas his antisocial instincts, his love of fighting, and his desire to rule are almost if not quite as strong as the impulses that make for unity and peace. The capitalistic system, by giving place to industrial rivalry, as well as cooperation, is well suited to the present state of human nature, and there is reason to think that, under collectivism, people would be too closely associated to remain at peace among themselves.

If the productivity of collective industry, within a given state, were reduced, there would be terrible disappointment among the workers, with mutual recriminations and a fierce struggle for shares in the diminished product. But if the national income were abundant, which is not likely, there would still be opportunity for disputes concerning the principle of division. Would the distribution be equal, according to efficiency, or according to needs? If according to needs, who could suggest a measure of needs other than the needs of the most efficient? If according to efficiency, could a satisfactory measure and test of efficiency be found and put into operation, and would the majority of the people, the relatively inefficient, ever consent to reward adequately the efficient services of their natural leaders? If equal distribution should prevail, and this would be most in accord with the traditions of socialism, what motives would operate to stimulate the latent energies of the workers, and prevent society from sinking to the dead level of uniformity and mediocrity? Socialists give no convincing answer to these questions, but express the hope that altruistic motives and the desire for honorable distinction would replace the love of material things which now controls the economic activity of the vast majority of mankind.

Another cause of infinite contention would be the assignment of workers to their proper places in the industrial army, and their promotion, when deserved, to higher or more desirable work. That all drudgery could be abolished, or by any device made as pleasant as other kinds of work, is not to be believed. Nor is it probable that the hours of work could be greatly reduced without a serious falling off in production. The election or appointment of officers, too, would be a source of endless trouble. If they were elected by their associates, it would be impossible to keep politics out of industrial life, and efficiency would be destroyed, while, if they were appointed from above, the way would be open for administrative tyranny and the utter destruction of democracy.

Again, there would be growing discontent among the consumers, as such, since production would not be regulated automatically, as now, but

artificially, by a central administration, remote from the individual consumers, and not readily persuaded to produce new commodities, or to improve the old, or to depart in any way from the established and intolerable uniformity.

It would be easy to mention other serious causes of dissatisfaction, which would inevitably result in political factions, class struggles, and a disorderly condition of things, necessitating the establishment of a standing army for the control of the discontented and the maintenance of law and order. From this it would be only a step to a system of compulsory labor, under which the masses of the people would be wage-slaves in a far worse sense than now, toiling for a bare subsistence, and exploited by an aristocracy of parasitic officials.

But it is not at all probable that revolutionary Socialists will ever be able to control the industrial life of more than one or two small nations, for the experience of these will be so disastrous as to deter the rest of the world from following in their footsteps.

Competition, after all, is the best and safest test of industrial efficiency. If governments show themselves able to compete with private enterprise in producing better results at a less cost of capital and labor, and if cooperative societies prove that they can do the same, then governmental and cooperative industries controlled, no doubt, by the laboring class, will possess the field, by virtue of superior efficiency, and the socialistic ideal will be realized by a process of slow and continuous evolution. But if not, capitalism will continue to exist, and the laboring class will find it to their advantage to preserve and foster it, while at the same time doing their utmost to remove abuses and to secure as large a share in the product as they can get without injury to the industrial system of which they form a part.

J. E. LE ROSSIGNOL.

SOCIALIST LABOR PARTY: A political party in the United States, organized in New York in 1876, mainly of Germans, under the name of the Social Democratic Working Men's Party. In 1877 it cast 1,365 votes in New York City, and the same year adopted the name of the Socialist Labor Party. In 1892 it first nominated presidential candidates and polled 21,157 votes. In 1897, however, the Social Democratic Party was formed, largely under the lead of Eugene V. Debs and others who believed in a party more genuinely American than the Socialist Labor Party, and one that could work in and through existing trade-unions, while the Socialist Labor Party believed in trade-unions but only in unions which would declare for socialism. The movement thus became divided. The Socialist Labor Party, however, mainly under the lead of Daniel de Leon, has continued its course, believing that the so-called "broader" policy of the Social Democratic Party (usually called The Socialist Party) would not endure. In 1896 the Socialist Labor Party polled 36,564 votes; in 1900, 34,191, and in 1904, 33,536 (the Social Democrat Party polling 408,230). The Socialist Labor Party is still largely a New York party and still largely German. In carrying out its principles it organized a Socialist Trade and Labor Alliance of a few Socialistic labor-unions opposed to the American Federation of Labor, and in return considered a "scab" organization by the American Federation. The "Alliance," how-

ever, has been virtually merged in "The Industrial Workers of the World" (q. v.). The party publishes *The Daily People*, edited by Daniel de Leon. Secretary of the party, Frank Bohn, 2 New Read Street, New York City.

SOCIALIST PARTY, THE (OF THE UNITED STATES) (for the earlier history of socialism in the United States, see **SOCIALISM, HISTORY OF**): The first Socialist political movement in the U. S. was the Social Party of New York and vicinity, in 1868; in the same year the first sections of the International Working Men's Association were formed. In 1871 the North American Federation of the I. W. A. began its agitation. In May, 1874, the Social Democratic Working Men's Party was organized. In July, 1876, this party and the I. W. A. united in Philadelphia under the name of the Working Men's Party of America, and in Dec., 1877, the name of this party was changed to the Socialist Labor Party of North America. Until 1898 this was practically the only Socialist political party in this country, surviving a number of serious internal controversies as well as adverse political conditions. In June of that year, partly because of dissatisfaction with the vigorous antitrade-union policy which dominated the Socialist Labor Party, partly because of the highly centralized power exercised over the party and its press by a few individuals, and also because it was felt that the methods of agitation of the party were not such as to appeal to the American working class, the Social Democratic Party was organized at Chicago. The organizers of the Social Democratic Party were themselves a bolting faction from the first national convention of the Social Democracy of America, which had been formed in 1897 by Eugene V. Debs at the final convention of the American Railway Union. The Social Democracy had had for its main object the formation of cooperative colonies, but also presented a political platform. In its first convention (June, 1898) a contest over whether the organization should continue as originally planned, or become purely a Socialist political party, resulted in a bolt of those favoring the latter policy and the formation of the Social Democratic Party, with the political organization of the working class for socialism as its one object.

The new party started out with a declaration of sympathy with the trade-union movement, and immediately began active political work. In Nov., 1898, it attracted universal attention by electing two members of the Massachusetts legislature and the Mayor of Haverhill, in the same state. Meanwhile the growing dissatisfaction within the Socialist Labor Party finally resulted in a revolt among its members against the dominant powers that dictated what was believed to be a ruinous policy. This revolt culminated in Aug., 1899, and out of the conflict came what was afterward known as the Rochester Socialist Labor Party, on account of the revolting faction holding a convention in Rochester, N. Y., in Feb., 1900. At this convention the administration of the old party was repudiated and a new line of general policy agreed upon, including an attitude of sympathy with the trade-union movement. A presidential ticket composed of Job Harriman, of California, and Max S. Hayes, of Ohio, was nominated.

In March, 1900, the Social Democratic Party held its first national convention at Indianap-

olis. To this convention came a delegation from the Rochester Socialist Labor Party, on a mission of unity between that party and the Social Democratic Party. As a result of the movement for unity amalgamation was thought to have been accomplished and a joint ticket was nominated, consisting of Eugene V. Debs, of Indiana, for president, and Job Harriman, of California, for vice-president. Later, however, differences arose which caused the establishment of another national headquarters at Springfield, Mass., in opposition to the one already existing at Chicago. There were, therefore, two separate organizations in the national campaign of 1900, each claiming the name Social Democratic Party, altho both supported the original ticket nominated at Indianapolis. In July, 1901, unity between these two rival bodies was accomplished under the name of the Socialist Party, which is the present organization.

At the present writing (Aug., 1907) the Socialist Party has state organizations in thirty-nine states and territories, and local organizations in the remainder. Its membership is estimated at between 30,000 and 35,000. Its national headquarters, since 1901, have been successively situated at St. Louis, Omaha, and Chicago, and they are now in the last city, in charge of a salaried national secretary. A regular corps of interstate speakers is kept in the field and the agitation and organizing work never stops. The party is known as the Social Democratic Party in Wisconsin and the Public Ownership Party in Minnesota.

Since 1899 the Socialist Party has elected state and local officials in many states, particularly Wisconsin, Illinois, Montana, and Pennsylvania, besides Massachusetts, already mentioned. In 1900 the national ticket polled 97,730 votes, and in 1904, with Eugene V. Debs, of Indiana, and Ben Hanford, of New York, as its candidates for president and vice-president, respectively, 408,230 votes were recorded.

The press of the party has grown rapidly. The principal periodicals appearing in English are: *The Worker*, New York (weekly); *Chicago Daily Socialist*; *The Socialist*, Seattle, Wash. (weekly); *Montana News*, Helena, Mont. (weekly); *Labor*, St. Louis (weekly); *Social Democratic Herald*, Milwaukee, Wis. (weekly); *International Socialist Review*, Chicago (monthly); *Socialist Review*, Hoboken, N. J. (semi-monthly). Of these *The Worker*, *Montana News*, and *Socialist Review* are owned exclusively by the party organizations where they are published. Among general propaganda papers supporting the Socialist Party are *The Appeal to Reason*, Girard, Kan. (weekly); *Wilshire's Magazine*, New York (monthly); the *Socialist Woman*, Chicago (monthly).

Of the large number of papers in foreign languages the most important are the German *New York Volkszeitung* (daily), established in 1878; the *Vorwärts*, New York (weekly); the *Arbeiter Zeitung*, St. Louis (weekly); *Die Wahrheit*, Milwaukee (weekly); the French *L'Union des Travailleurs*, Charleroi, Pa. (weekly); the Polish *Robotnik*, Brooklyn (weekly); the Bohemian *Spravodnost*, Chicago (weekly); the Jewish *Forward*, New York (daily). In addition, the party has the open support of many trade-union journals in different languages, including the *Brewers' Journal*, Cincinnati (weekly); *Cleveland Citizen*,

Cleveland, Ohio (weekly); *Miners' Magazine*, Denver, Colorado (weekly).

As a part of the International Socialist movement, accepting the platform and principles of that movement, the Socialist Party is represented at the International Socialist Bureau at Brussels and takes part in the congresses of the International Party of Socialism.

WILLIAM MAILLY.

SOCIALISTS OF THE CHAIR: In 1871, in Germany, Herr Offenheim, in the *National Zeitung*, dubbed those professors of political economy who inclined toward certain socialistic views, *Katheders Sozialisten* (Academic Socialists or Socialists of the Chair). The term was taken up and accepted by Professor Schmoller (*q. v.*) in his opening address at a gathering at Eisenach in 1872 of those who sympathize with the view, and it led to somewhat of a movement in Germany, and the formation in 1873 of the *Verein für Sozialpolitik* (Social Economic Club), an organization to represent their views, holding meetings almost annually and producing considerable literature. The name has passed into other countries, and in England and America is applied to professors (and they are not a few, see **SOCIALISM**) who incline to certain socialistic propositions. Nevertheless, Socialists of the Chair are not Socialists. In Germany, especially, they stand for little more than an expansion of the paternal State, while Socialists oppose paternalism.

Professor Schmoller, in his opening address at Eisenach, said:

"The marked division of classes in the midst of existing society, the open war between masters and workmen, between owners and proletarians, and the danger, still distant but threatening the future, of a social revolution, have for some years caused doubts to arise as to the truth and definitive triumph of the economic doctrines represented by the congress of economists; and on all sides it is questioned whether absolute freedom of labor and the complete abolition of the antiquated regulations of the Middle Ages will bring about that perfectly happy situation which the believers in *laissez-faire* have so enthusiastically predicted." (While thus separating himself from the old optimism of the Manchester party [*Das Manchesterthum*], Schmoller was careful to show that he did not accept the conclusion of the Socialists.) "Tho by no means satisfied," he said, "with existing social conditions, and convinced of the necessity of reforms, we preach neither the upsetting of science nor the overthrow of the existing social order, and we protest against all socialistic experiments. All the great advances shown in history have been the results of the work of ages. The existing economic legislation, the present methods of production, the psychological conditions of the different classes, ought to be the basis of our reforming energy. We demand neither the abolition of industrial freedom nor the suppression of the wage system; but we do not wish, out of respect for abstract principles, to allow the most crying abuses to become daily worse, and to permit so-called freedom of contract to end in the actual exploitation of the laborer. We do not desire the State to advance money to working men in order that they may make experiments on systems inevitably destined to fail; but we demand that it should concern itself, in an altogether new spirit, with their instruction and training, and should see that labor is not conducted under conditions which must have for their inevitable effect the degradation of the laborer."

SOCIOLOGICAL SOCIETY, THE (English): The Sociological Society was constituted in Nov., 1903, by a combination of representatives of all departments of social investigation, as well as of practical interests, political, educational, philanthropic, religious, etc.

The aims of the society are scientific, educational, and practical. It seeks to promote investigation, and to advance education in the social sciences in their various aspects and applications. It aims at affording a common ground on which workers from all fields and schools concerned with

social phenomena may meet. Economist and historian, psychologist and moralist, anthropologist and archeologist, geographer and naturalist, as also physician and alienist, criminologist and jurist, hygienist and educationist, philanthropist and social reformer, politician and cleric.

The Sociological Society prosecutes its work by means customary to an efficiently organized learned society, namely, meetings for papers and discussions, the collection of relevant periodical and book literature, and by publications. For papers and discussions the society holds meetings in its rooms, 24 Buckingham St. The society also publishes a quarterly journal, *The Sociological Review*.

The foreign correspondents of the society include many of the most eminent continental and American sociologists. Membership is open to all interested in sociological studies. *Secretary*, Dr. Slaughter. *Address*: 24 Buckingham St., Strand, London, W. C.

SOCIOLOGY (from Latin *socius*, a comrade, whence *societas*, society, and Greek *λογος*, reason) is in general the science of society. Three distinct conceptions of the science have, however, prevailed. It has been conceived (1) as a mere coordination of the various particular social sciences; (2) as itself a particular science dealing with all social relations not considered under other social sciences; (3) as a science of the fundamental laws and general principles underlying all social phenomena. This is the view which obtains to-day with the best thinkers. It is a modern science. Plato, Aristotle, Aquinas, Hobbes, Locke, Montesquieu, Rousseau, Hume, Bentham, Burke, Hegel, Fourier, and others developed many profound and valuable thoughts as to social principles, yet Comte (*q. v.*) in 1838 first used the word sociology for the science of society, or social physics, as he called it, and first developed social principles in a systematic way, based, as he believed, on an induction from facts. He conceived of the social world as a unity, looked at according to his well-known analysis of the history of human thought, first theologically, then metaphysically, and lastly positively, or as a mere study of facts apart from all preconception. But Comte's acquaintance with social facts was limited. Jacques Quetelet in his "*Du Système Sociale*" (1848) and "*Physique Sociale*" (1855) laid the foundations and developed the methods of quantitative—that is, of scientifically exact—studies of social phenomena. Herbert Spencer (*q. v.*) introduced the conception of evolution and formulated the great basic propositions of evolutionist sociology. His "*Principles of Sociology*," as a developed part of his synthetic philosophy, did not begin to appear till 1876, but most of his more important positions are already developed in his earlier works. With wide knowledge he undertakes to explain the genesis of all phenomena, mental and natural, in accordance with a universal law of evolution. Mr. Spencer's social theories, however, have not satisfied those who believe that the State should assume more than the simplest governmental functions. Lester F. Ward ("*Dynamic Sociology*," vol. i., p. 218) says of Spencer:

No man probably ever wrote as much as he has written without saying more than the average judgment of mankind could not indorse as soon as presented. . . . Paradoxical as it may sound, and whether it be construed as complimentary or otherwise, Mr. Spencer has too much good sense and too much real knowledge to build a perfect system of philosophy.

The biological conception of society is minutely carried out by the German A. Schäffle (*q. v.*) in his "Bau und Leben des sozialen Körpers" (1875), and by the Belgian Guillaume de Greef in his "Introduction à la Sociologie" (1886-89). In the United States Lester F. Ward, in his "Dynamic Sociology" (1883), "The Psychic Factors of Civilization" (1893), "Pure Sociology" (1902), and "Applied Sociology" (1906), lays emphasis upon the self-conscious purpose of man as a controlling factor in the advanced stages of social evolution. His works are of special importance in reform because of his argument that at a certain point the natural evolution of society passes over into an artificial and teleological evolution. Mr. Ward's belief that society can consciously determine its own status perhaps contributes to socialism as truly as Mr. Spencer's position opposes socialism. At least mention should be made of an earlier American who, tho not using the term sociology, nevertheless treated sociological subjects with some originality and force—Henry C. Carey (*q. v.*). He published his "Principles of Social Science" in 1858-60, grouping all phenomena round the principle of association, but somewhat forcing facts to suit his own fancies about association. More recent writers have found various principles as the elementary and distinctive principle of society. Gabriel Tarde ("Les Lois de l'Imitation," 1890) finds it in imitation; Ludwig Gumplowicz ("Der Rassenkampf," 1883, and "Grundriss der Sociologie," 1885) finds it in the conflicts, amalgamations, and assimilations of heterogeneous ethnical groups; J. Novicow of Odessa ("Les Luttes entre les Sociétés Humaines," 1893) finds it in the variation of conflict and alliance; Émile Durkheim ("De la Division du Travail Sociale," 1893) finds it in a division of functions creating not only division, but solidarity, ethical and moral as well as economic; John S. Mackenzie ("An Introduction to Social Philosophy," 1870) elaborates the Platonic or moral-organic conception of society; Gustav Ratzenhofer ("Wesen und Zweck der Politik," 1893, and "Die Sociologische Erkenntniss," 1898) and Albion W. Small ("General Sociology," 1905) interpret society in terms of *interests*. Small has given particular attention to the progress of method in sociology which he says has been marked from Spencer to Ratzenhofer "by gradual shifting of effort from analogical representation of social structures to real analysis of social processes." Prof. F. H. Giddings first in numerous articles, and in 1896 in his "Principles of Sociology," held that "the original and elementary subjective fact in society is the consciousness of kind" (p. 17). In later works ("Elements of Sociology," 1898, "Inductive Sociology," 1901, and "Descriptive and Historical Sociology," 1906) he derives the consciousness of kind itself and all other social phenomena, from the varying degrees of like and unlike response, by like and unlike individuals, to a common stimulation. Out of these elements are built up concerted volition and social control, and social organization, the function of which is to create and maintain the social welfare. Such, in brief, is the development of sociology up to the present time. We shall now consider its content and main positions, following, for the most part, the outline of the last-named author. According to him descriptive sociology comes first, a knowledge of the facts being of necessity preliminary to their analysis. Society is not limited to human beings;

most animals are social. The associations of the ants, bees, and beavers are well known. Among mammals and birds isolated lives are rare. Some degree of aggregation is necessary usually to preserve life in the struggle for life. In his "The Ascent of Man" Professor Drummond has developed the thought that the struggle for the life of others is a necessary concomitant of the struggle for life of self. Say the authors of "The Evolution of Sex" (p. 279): "The activities of even the lowest organisms are often distinctively referable to either category. . . . Hardly distinguishable at the outset, the primitive hunger and love become the starting points of divergent lines of egoistic and altruistic motion and activity." Kropotkin emphasizes the fact played by the social life in animal evolution in his use of Brehm's "Illustriertes Thierleben." Aggregation is of two kinds: genetic, or by descent from a common ancestor, and congregate, or by the coming together of individuals. The patriarchal theory of the origin of society supposed a genetic basis; the social-contract theory, a congregate basis. Neither is exclusively the case. External physical conditions, as necessity of food and water and protection, compel aggregation. Yet the evidence that close interbreeding is injurious is familiar and is generally accepted as conclusive.

We come next to consider the social mind. This is not an abstract but a concrete thing. It exists only in individual minds, and yet is more than any individual mind; it is the phenomenon of individual minds in interaction. Aggregation is supplemented by various processes of communication, suggestion and imitation, conflict and association, all constituting an interstimulation and responsive mind in relation with mind. In this process resemblances and differences are accentuated, like natures become aware of their similarity, the consciousness of kind arises, and assimilation begins. Like response to common stimulation played upon by the consciousness of kind becomes concerted volition and develops into cooperation. In animals the social mind is instinctive only. In the lowest men and on occasions among more highly developed men it is mainly instinctive and emotional, manifesting itself in panics, fads, crazes, mobs, revivals, revolutions, lynching, etc.

The social mind acquires continuity through the social memory or tradition. Tradition is the integration of the public opinion of many generations. Primary traditions are economic, juridical, political, and are developed in this order. Secondary traditions are personal, esthetic, and religious. Tertiary traditions are theological, metaphysical, and scientific. The highest form of the social mind is attained through investigation and discussion and the evolution of a reasoned public opinion.

The social organization includes the social composition, or groupings in which individuals or minor groups of individuals dwell together, and the social constitution, or groupings in which individuals work or otherwise act together whether they dwell together or not. Social composition begins with the family group. Not much social composition is found below the birds, tho nearly all birds live in families. Brehm declared that genuine marriage could be found only among birds. ("Thierleben," *bd. iv.*, p. 20.)

Groups which are composed of families are

either ethnical, that is, composed of kindred and genetic; or demotic, that is, associate and civil. (See *FAMILY*.)

The composition of demotic societies into villages, towns, counties, states, nations, is well known (*q. v.*). This social composition is psychological rather than physical. The constitution of society is its organization into specialized associations for various social ends. Examples are municipal governments, churches, schools, industrial corporations, societies, clubs, etc. In the tribal society composition and constitution are substantially identical.

In civilized communities the constitution of society is like a great circle with numberless small circles within it. Socialists are right in saying that the State could do all; individualists are right in saying that society could get on without government; but neither is the normal development. The end of society is the evolution of the rational and spiritual personality of its members. Cultural associations develop this and are religious, educational, scientific, ethical, esthetic, or what is called polite society. Economic, legal, and political associations exist in a functional sense for the sake of cultural organization and activity. Psychologically the social constitution is the exact opposite of the social composition. It is an alliance of the like and the non-toleration of the unlike in each simple association, supplemented by toleration and consideration of the unlike in complex association.

Historical Sociology

Historical sociology Professor Giddings divides into four parts. (1) Zoogenic association (association of animals) long preceded the association of men and deeply affected animal life. Indeed we may say that association or society has been the supreme element in the struggle for existence. It was Mr. Darwin's dictum that "those communities which included the greatest number of the most sympathetic members would flourish best" (quoted in Drummond's "The Ascent of Man," p. 238). Kropotkin says, "Sociability is as much a law of nature as mutual struggle" (*Nineteenth Century*, 1890, p. 340). Herbert Spencer says of the ethical bearings of altruistic principles ("Principles of Ethics," vol. ii., p. 5): "Animal life of all but the lowest kinds has been maintained by virtue of them. Excluding the *Protozoa*, among which their operation is scarcely discernible, we see that, without gratis benefits to offspring and earned benefits to adults, life could not have continued."

"The ant," says Kropotkin, "thrives without having any of the 'protective' features which cannot be dispensed with by animals living an isolated life."

In their societies parrots find infinitely more protection than they possibly might find in any ideal development of beak and claw. Horses, badly organized on the whole for resisting both their numerous enemies and the adverse conditions of climate, would soon have disappeared from the surface of the earth were it not for their sociable spirit. When a beast of prey approaches them several studs unite at once, . . . and when a snowstorm rages in the steppes each stud keeps close together and repairs to a protected ravine. . . . Life in societies enables the feeblest insects, the feeblest birds, and the feeblest mammals to resist or to protect themselves from the most terrible birds and beasts of prey. . . . We maintain that under any circumstances sociability is the greatest advantage in the struggle for life. (Kropotkin, *loc. cit.*, pp. 7-11.)

(2) But after zoogenic comes anthropogenic association. There is here, however, no break. Society produced man rather than man society. The ape-like forerunner of man is social. (See Darwin's "Descent of Man," p. 180.) Language

is necessary to human development and society is necessary to language. Most evolutionary thought here has gone astray. Mr. Fiske argues that social development followed from prolonged infancy, but this forgets that association must precede prolonged infancy. The brain is the result of association and man the creature of social life, rather than social life the work of man.

Mr. Lester F. Ward (in *American Anthropologist*, vol. viii., No. 3, July, 1895) also argues that "man's erect posture is chiefly due to brain development," and that his psychologic evolution is to be explained largely by association.

Such is this view of the genesis of the human species, in society, rather than of society from man, tho Mr. Giddings reminds his reader that the conclusions are yet merely hypothetical. Economic ideas, even of tools, political ideas of toleration and obedience and of kinship, have their beginnings in the animal world. Characteristic of the beginnings of human society were the primitive explanations and traditions of life, death, and causation, as animism and the ghost theory.

(3) Coming now to ethnogenic associations, we find that self-consciousness is that which distinguishes human from animal communities. At

Ethnogenic Association

first, however, the social constitution is not different from the social composition. The first groups were probably formed of family groups.

At the same time the relations of the sexes may have been the loosest. The family relation can and probably did coexist with the greatest sexual irregularities, especially at the great gatherings and festivals. The trading and lending of wives was common. It is probable that the domestic group was simply a monogamous family, mainly the result of male jealousy and power, as held by Darwin and Maine; with polyandry and polygyny the exception. (See *FAMILY*.) The male probably often deserted the female with her children, and they would know only the mother, thus accounting for the matronymic clan. The union of hordes produces the tribe, and the union of tribes an ethnic nation. In horde, clan, or tribe, chieftaincy can become hereditary; the clans are the juridical organization; the phratry is the religious organization guarding the religious tradition. Its secret societies of medicine-men give the germs of the professional class; the sachems elected by clansmen and clanswomen are the first judges. Chieftains become the founders of a nobility. There results a feudalism (*q. v.*) which prepares the way for another system.

In demogenic associations the social composition is subordinate to a developed social constitution. It has three stages. In the first all the energies of society are concentrated upon political integration and defense, as in Egypt and Babylonia; in the second there is a critical effort to achieve the union of personal liberty with stability through the constructive evolution of municipal constitutional law. Greece failed in construction and Rome sacrificed spontaneity to system. This stage went on through the Middle Ages, the Reformation, the French and American Revolutions. The third stage is industrial. The development of the fundamental social interests thus reverses the order of their genesis.

We found that there were three fundamental social traditions—economic, legal, and political—evolved in this order. But when society, build-

ing on these traditions, reaches the political stage it puts its social energies into perfecting that first, and then works back and perfects its legal and then its economic life. So with the secondary traditions of the personal or animistic, the esthetic and religious. When society has reached the political stage it has by no means perfected its secondary traditions, and therefore, in so far as it busies itself with intangible concerns, it interests itself in religion, then in art, then in personal interests.

Philosophy of History

The tertiary traditions, however, follow a different order. In the religious-political age the human mind is theological; in the critical age it is metaphysical; only in the economic and spiritual age it is scientific. The stages of civilization are then military, religious, and theological; liberal, legal, and metaphysical; finally, economic, ethical, and scientific.

In this philosophy of history will be seen both the basis and the inadequacy of Comte's trilogy of the theological, the metaphysical, and the positive; of Hegel's conception of the evolution of the personality of man, disregarding the stages of society; and Mr. Spencer's evolution of society in terms of differentiation of structures, and finding only two types, the military and the industrial.

Ethnic societies that have reached the age of confederation and kingship become lawless and aggressive. Migration and conquest result. The great historical races are the result of the superposition of races upon races, as in Egypt.

As a result of such conquests society becomes mingled, sovereignty is developed, the social constitution becomes more than the social composition, life and property become more secure than in nomadic days; wealth develops, trade flows to centers, division of labor between city and country grows. Traders come and outdo in wealth the older population. The problem is to incorporate, under political form, congregate societies. The genetic form of society gives place to the civil. Church and State are organized. Ethnic unity, however, is not lost. Territory is more thought of. Political integration goes on. Strong states absorb the weak. The community, too, reacts on the individual. Gradually the military state is outgrown. Natural selection favors those adapted to the dominant social characteristics. Selection, for example, has produced the American spirit, with its desire for change, its love of experiment, and its respect for enterprise. The legal and critical age is born. Voluntary organization, under the authority and protection of law, assumes endless variety. It produces personal liberty. There is much inherent democracy in mere numbers. But the development of liberalism disintegrates the social composition. The religious-proprietary family is weakened. Liberalism substitutes contract for custom. The authority of the parent is weakened. The family becomes romantic and unstable. Liberalism, too, weakens the State, but it increases wealth and introduces the industrial age. Increase of wealth multiplies population, if

not by increasing the birth-rates, by decreasing death-rates. The corrected Malthusian formula is: "In any given state of industry and the arts population tends to increase faster than it is possible to raise the general plane of living." This quickens invention and in-

dustrial progress begins anew. Invention is rhythmic. Spencer is right ("Principles of Biology," vol. ii., pt. 6), as Professor Lavasseur, M. Dumont, and Miss Brownell have shown that the birth-rate diminishes as individual evolution increases. This is partly the result of physiological changes, but mainly the result of psychological reasons. There is a deliberate prevention of births. The "preventive check" has come into general use, as in France and New England. But this proves not the falsity but the truth of Malthusianism. It gives indubitable proof that population feels the tendency to increase faster than it is possible to raise the general plane of living. Demogenic association develops classes and the class struggle. Disintegration of the social constitution shows itself in the city; savagery threatens the cities, but first private philanthropy, and then communal intelligence, awaken ethical character and effort and check the savagery. Society thus becomes more reflectively self-conscious and studies more the possibilities of both free contract and authority.

This leads us to the study of explanatory sociology, or the consideration of social law and cause. The initial causes of society are physical,

Cause of Progress

but association furthers survival and happiness, and develops the conscious individual and the conscious society. Relations and activities are valued, choices are made, policies are devised, institutions founded. Natural selection works among these. The further task of sociology is to discover and use the details and laws of these complicated processes. Society is often described as an organism, but it is more. It is essentially psychical. It is more than a multitude of individual minds. Personality is a unity, but it is not indivisible or undecomposable.

Undoubtedly the individual will plays a large part in human life, but the question is whence comes the individual will. Sociology, as a science of natural causation and natural law, declares emphatically that the individual is, at least to a very large extent, the product of environment, including the social will. Man is a variable, but not an independent variable. The theory of natural rights is given up to-day by science, but there are norms of rights, socially necessary laws, which science is beginning to discover. Society is a psychological organization rather than a physical organism. Sociology then teaches that the struggle for life brings individual beings into a certain amount of aggregation; that a consciousness of kind begins in the earliest animal life; that the struggle for life is aided in the earliest stages by what Drummond calls the struggle for the life of others; that thus from aggregation there comes a more or less conscious association; that this reacts upon and develops the individual; that a social mind is developed, and eventually express in social purposes and control; that there follows a struggle for existence between, and a survival of, the fittest social institutions, and thus we have the persistence and coexistence of the highest personality and the highest social organization.

Society is not a physical organism, but it is a psychological organization of conscious organisms.

SOETBEER, ADOLPH GEORGE: Statistician and political economist; born in Hamburg, 1814; taking his degree at Göttingen, entered the education department of the city of Hamburg, and later the Hamburg Deputation of Commerce, he became an authority on financial questions. Called "the father of German gold coinage," he regrets the decline in value of silver and favors the adoption of one gram of fine gold as an international unit of value, the coinage of gold to be free, on payment of a seigniorage, but no gold coin containing less than 5.8065 grams of pure gold to be minted. All nations to coin silver in the ratio of 20 to 1, but its coinage not to be free. In 1872 he became professor of political science at Göttingen. Died Oct. 23, 1892.

Author of numerous works, he is best known for his tables of prices.

SOLVAY, ERNEST, AND THE SOLVAY INSTITUTE: Founder of the Solvay Institute at Brussels, Belgium; born in Brabant, 1838; manufacturer and inventor; he has made a fortune in the manufacturing of soda by a new process, being often spoken of as the Soda King. He has introduced various industrial betterment features into his factories, and founded (1901) and endowed the Solvay Institute, in Brussels, a large and well-equipped institute devoted to all forms of sociological research. He had previously founded an institute of physiology, and has been a large benefactor of the University of Brussels. He has received many honors from the State, and was elected senator, as a Liberal, in 1893 and 1897. Address: Solvay Institute, Leopold Park, Brussels, Belgium.

SOMERSET, LADY HENRY: Daughter of Earl Somers of Eastnor Castle, Herefordshire; president of British Woman's Temperance Association; born in London, 1851. She was married in 1872 to Lord Henry Somerset, the second son of the Duke of Beaufort.

For some years Lady Henry was often at court, and a leader in the fashionable society of London, but this position was not congenial to her tastes.

Leaving London in the year 1878 for one of her father's beautiful country places, she remained there for many years in comparative retirement with her son. In 1884 Lord Somers died, leaving Lady Henry Somerset heir to Eastnor Castle, Somers Town (London), and Reigate. The responsibility of administering an estate involving a tenancy of more than one hundred thousand persons deeply impress the mind of Lady Henry Somerset, and in a crisis hour she seemed to hear a voice saying to her: "Act as tho God were and thou shalt know He is." This was the turning-point of her destiny, for she renounced society, broke away from her former relationships at the cost of criticism and alienation, and went with her son to Eastnor Castle, 100 miles from London, where for five years she lived among her tenantry without comradeship of any kind save as Christian workers, whom she invited, came and went from time to time. She built chapels, hired missionaries, held meetings for the miners in Wales near where she had spent some years of her married life, and in every way improved the con-

dition of those dependent upon her. Mrs. Hannah Whitall Smith, an American lady and a leader in the Woman's Christian Temperance Union, came to Eastnor by invitation, and from her Lady Henry Somerset heard the history of the crusade in Ohio, the organized movement which followed it, and the wide sweep of the World's Woman's Christian Temperance Union. By Mrs. Smith's request, Lady Somerset consented to accept the presidency of the British Woman's Temperance Association, which had been founded as the result of a visit made by Mother Stewart to Great Britain in 1876. This was in 1890. In 1891 Lady Henry, with Mrs. Hannah Whitall Smith, came by invitation to the first convention of the World's Woman's Christian Temperance Union in Boston, Mass., presided over by Miss Frances E. Willard. She was so deeply impressed by the White Ribbon women and their work that she remained six months in America, being associated with Miss Willard in the editorship of the *Union Signal*, the organ of the women's White Ribbon movement.

In April, 1891, Lady Henry Somerset returned to London. In August of that year Miss Willard lost her mother and went to Eastnor Castle. By their united efforts the British Woman's Temperance Association was reconstructed on the lines of the modern temperance movement as illustrated in the World's Woman's Christian Temperance Union, the central idea of which is to correlate the temperance movement with other reforms such as the enfranchisement of women, the labor movement, the social purity movement, all of which are inextricably intertwined with the temperance reform itself.

In the previous year, 1892, Lady Henry had assumed the editorship of a London paper called *The Woman's Herald*, but in 1894 the name was changed to *The Woman's Signal*. It is now the leading woman's paper of Great Britain in the world of philanthropy and reform.

Lady Somerset is strongly opposed to all organizations and declarations in which "profession mocks performance." She has more and more connected herself with the labor movement and with a practical "Christian socialism."

FRANCES E. WILLARD.

SOUTH AFRICA, including Cape Colony, Natal, Orange River Colony, the Transvaal, Rhodesia, Swaziland, Basutoland, and Bechuanaland, comprises one of the largest and most important portions, having 1,313,000 sq. m., compared with 1,766,000 in India, 2,972,000 in Australia (commonwealth), 3,653,000 in Canada, and an estimated population of not under 7,000,000 (white, 1,135,016), compared with 294,000,000 in India, 4,000,000 in Australia (commonwealth), and 5,000,000 in Canada.

(For all statistics, dates of acquisition, etc., see BRITISH EMPIRE, p. 131.)

The office of High Commissioner in and for South Africa was created in 1878. He is also governor of Basutoland, administers the protectorates of Bechuanaland, Swaziland, and Rhodesia, and represents the crown in all extra-colonial South African matters. A customs convention of the four colonies met in 1906 and arranged for increase of duties with preferential rates for all portions of the British Empire granting preferential rates to South Africa. South Africa has large industrial possibilities, important mineral resources, and vast undeveloped territo-

ries. It had in 1906 1,789 miles of railway with 644 miles under construction.

It has, however, had serious social problems, primarily those concerning the employment of Chinese labor (for which see CHINESE LABOR IN SOUTH AFRICA), and the political and constitutional troubles growing out of the Boer War. There has been much complaint about the lack of self-government, which is, however, now being gradually granted. The critics of the British Government's policy in the Boer War claimed that it was an unjust and inhuman war, in the interests of grasping British capitalists owning the mines in the Transvaal, who demanded and got the British Government to back up unjust demands from the Boer Government. The defenders of the war argued that the Boer Government had not and would not treat its British subjects with fairness; taxed them without granting them representation; refused them enfranchisement and suffrage; and that a government conducted on such antiquated and narrow ideas as those of the Boers, and which would not listen to reason or equity, must be forced to be just and progressive. To-day in the Transvaal the main parties are the Progressives, which represent the capitalists; the Independents, who oppose Chinese labor and claim to represent "Transvaal liberalism"; the Het Volk, or Boer Party, and the Labor Party. The government has recognized politically no difference between Britons and Boers, with universal male suffrage on the basis of one man one vote. The exports and imports of the Transvaal are greater than all the rest of South Africa combined. If the labor and racial problems be solved as they are now promised to be solved, South Africa is believed to have a very large future.

SOVEREIGNS OF INDUSTRY, THE: This was an order established in New England Jan. 6, 1872, to develop cooperative stores for the working classes similar to the cooperative movement started by the Grange (*q. v.*). Its leaders were William Earle and John Orvis. Many stores were started and much interest was taken, but the stores, which were to sell at cost, were undersold and run out by competition. Later they introduced the Rochdale system advocated from the first by Mr. Orvis, but it was too late, and the order failed about 1879, tho a few stores survived. (See COOPERATION.)

SOVEREIGNTY in political science Professor Burgess ("Political Science and Constitutional Law") defines as "original, absolute, unlimited universal power over the individual subject and over all associations of subjects." Jellink defines it as "obligation through its own will." It is the most essential principle of the State. (For the development of the idea of sovereignty, and the views of it held by different writers, see articles POLITICAL SCIENCE and STATE.) Sovereignty, according to most modern writers, though not all, is based upon force. "The one thing that characterizes the State is coercive power" (Leroy Beaulieu, "The Modern State"). "Force is an absolutely essential element of all laws whatever" (James Fitzjames Stephen, "Liberty, Equality, and Fraternity"). "Penal sanction is the essence of law" (John Stuart Mill, "Utilitarianism"). "Let the edifice of law be as moral and effectual as you will, its foundation is the force of the community" (Goldwin Smith, "Essays on Questions of the Day").

Other thinkers, however, deny this. Bluntschli distinguishes between force and power. Woodrow Wilson calls sovereignty "a catalogue of influences." Lieber calls it "the sense and sentiment of the community." Hume says that government is founded on opinion, and "that force is always on the side of the governed." Austin says, "The monarch is superior to the governed . . . to an indefinite tho limited extent." (For the relation of sovereignty to liberty, see STATE.)

SPAHR, CHARLES B.: Editor, economist; born 1860 in Columbus, Ohio; graduated at Amherst College in 1881. During the years 1884-85 he studied in Germany, at Leipsic. On his return to America he became editorial writer on *The Outlook*, a position he held until his death. Besides this, from 1889 to 1891 he was on the editorial staff of the *Commercial Advertiser*. In 1890 was made lecturer on taxation and the distribution of wealth at Columbia University. He wrote various articles and essays on the taxation of labor, the single tax, etc. He died in 1904. Author: "The Present Distribution of Wealth in the United States"; "America's Working People."

SPAIN: A monarchy of Europe. Area, including the Balearic and Canary Islands with smaller possessions on the north coast of Africa, 194,783. Population in 1900, 18,618,086, or 96.7 per square mile. The principal cities are: Madrid, 539,835 inhabitants; Barcelona, 533,000; Valencia, 213,530; Seville, 148,315; Malaga, 130,109; Murcia, 111,539; Cartagena, 99,871.

There were in 1905: Marriages, 136,947; births, 669,765; deaths, 491,372; surplus of births, 178,393. In 1901 there were 56,906 emigrants; 1905, 126,067; chiefly to Brazil, Uruguay, and Argentina.

The State and national religion of Spain is the Roman Catholic, to which practically all inhabitants belong with the exception of 6,654 Protestants, 9,645 Rationalists, 402 Jews, and 13,175 not stated. The Church is supported by the State at an annual expense of about 41,000,000 pesetas. There are in all 10,630 monks and 40,000 nuns. Vast amounts of property are in the hands of the Church.

Education is on a low level, altho some progress has been made since 1860 when 75.3 per cent of the population were illiterate; the percentage in 1889 was 68.1 per cent. In 1902 a law was passed for a closer inspection of all schools, and a regular system of supervision was introduced. The annual expenditure for 25,340 public primary and grammar schools and 1,617,314 pupils was in 1901 about 25,000,000 pesetas or francs. There were also 6,181 private schools—mostly belonging to monastic orders—with 344,380 pupils. Each of the 49 provinces is required to have a secondary school or "institution," which prepares for the universities, of which there are 9 with 16,000 students. The government supports also a number of technical and professional schools. Its total expense for educational purposes was 43,122,259 pes. in 1903.

The occupations of Spain are chiefly agricultural, since 79.65 per cent of the total area is classed as productive, divided between farming vineyards, olive culture, meadows, and fruits. The soil is divided among a large number of proprietors, 3,426,083.

Mining is of considerable importance, since Spain is rich in minerals; 93,375 workmen were employed in 1904 in 1,869 mining concessions. The total value of the mineral output was 170,456,511 pesetas; the principal items were:

Industries

Iron ores and pyrites, 42,793,335; cuprous iron pyrites, 41,467,289; coal, 28,099,625; argentiferous lead ore, 27,885,347.

Cotton manufactures use about 68,300 looms with 2,614,500 spindles. Silk manufacturers produced (1900-1) 700,000 kilograms of raw silk; 30,000 tons of cork are manufactured annually.

The commerce of Spain is not extensive since the loss of her West Indian colonies. In 1905 the imports amounted to 884,808,644 pes., chiefly stone, minerals, glassware, and pottery; drugs, cotton, grain, sugar, and other food products; the exports to 1,018,387,334, chiefly minerals, metals, food products, and wine—103,008,188 pes. Imports were chiefly from Great Britain, France, and the U. S.; exports chiefly to Great Britain, France, and Cuba.

The merchant navy of Spain consisted in 1905 of 449 steamers with 434,846 tons net, and 541 sailing vessels with 85,583 tons net.

The Constitution of Spain dates from June 30, 1876. It provides for a hereditary king or queen; a parliament called *Cortes*, with a Senate and Congress, equal in authority. In the former there are 360 members; 180 are appointed for life, hereditary, or become members by virtue of wealth; 180 are elected, and must be renewed one half every five years. The Congress is elected, one member to every 50,000 of the population. Their present number is

Constitution

406; they cannot take offices, pensions, or salaries. The only remuneration members of Parliament receive is free transportation. According to the law of June 26, 1890, all male Spaniards, twenty-five years old, citizens of a municipality for two years, in full civil rights, may vote.

The king with nine cabinet ministers is the executive of the country; his person is inviolable.

Many changes in the ministry have taken place the last few years, owing to an agitation to introduce bills for "civil marriages" and for separation of State and Church.

The finances of Spain are in a favorable condition, apart from the public debt.

The revenue is chiefly from direct and indirect taxes, stamp duties, government monopolies, and income from State estates. It amounted in 1906 to 1,010,337,296 pesetas; the expenditure to 968,856,760—chiefly for public debt, army and navy. The public debt in 1906 amounted to 9,478,062,148, the interest for which in 1907 was estimated to be 389,012,752 pes.; that is, about 20 pes. charge per head per annum, and over 500 pes. capital debt per head.

Railways had a length of 9,190 miles in 1906, and are all in private possession. The postal service had 3,903 offices; receipts, 25,924,823 pes.; expenses, 8,953,727; surplus, 16,971,096. Telegraph lines had a length of 20,100 miles in 1904 with 47,400 miles of wire, and 1,645 offices.

Army and Navy.—Military service is compulsory, but in the form of conscription rather than of universal service. The army is in a transitive stage, and numbered an effective peace strength of 80,000 in 1903, with about 40,000 men detailed in skeleton formations, fortresses, etc.

The navy numbers 16,700 men of all ranks and 9,000 marines. The Cortes passed bills in 1905 for a greatly enlarged navy.

SOCIAL REFORM

This has but scarcely begun in Spain. A Socialist agitation began in 1882, but was anarchist rather than true socialism. This element, however, is disappearing, and a somewhat true Socialist Party has been developed. In 1893 it cast 7,000 votes, and in 1905, 23,000, a decrease from the vote of 1904—29,000. The party has no representative in the Cortes, but has elected 50

councilors in 22 towns or cities. The leading Spanish Socialist is a councilor of Madrid. There are 7 Socialist weeklies, the leading one, *El Socialista*, of Madrid. The most powerful Socialist society, however, is the General Federation of Trade Unions, composed of 253 unions with 34,537 members.

There are reported 140 cooperative societies in Spain, of which 100 are in a national union. Their entire annual trade is \$80,000. Most of these are distributive, but there are also cooperative brickmakers, upholsterers, shoemakers, and cotton-spinners.

The revolt against the Vatican has spread to Spain, and the government is promoting an Associations Bill which seeks to define the exact position of the Church in regard to the State.

The Church realizes that it must do something. Led by the Bishop of Madrid, several Spanish bishops are organizing classes and courses of social studies for their priests, so that they can lead a social-reform movement. Unions of working people, under the guidance of the Church, are being formed in the industrial centers, and in some rural sections. Rural and other cooperative societies are being agitated. A Catholic magazine has been started to direct the movement.

SPARGO, JOHN: Socialist and reformer; born in Cornwall, England, in 1876. Starting out as a nonconformist minister, his interest in social questions and the Labor movement led him to leave the ministry; working at first as a granite-cutter, he has been in turn Labor leader, settlement worker, lecturer, and journalist. He was for six or seven years on the executive council of the English Social Democratic Federation. In 1900 he came to this country "to escape having to go to the House of Commons," politics being exceedingly distasteful to him. He was one of the founders and editors of *The Comrade*, an artistic Socialist monthly. He has served on the national committee of the Socialist Party and lectured for it extensively. He is now an editorial contributor to several journals and is a prolific writer on art, socialism, and kindred topics. Among his works are: "The Bitter Cry of the Children"; "The Socialists: Who They Are and What They Stand For"; "Socialism: A Study and Interpretation of Socialist Principles"; "Art, Life, and Freedom"; "Capitalist and Laborer." Address: Yonkers, N. Y.

SPARTACUS, by birth a Thracian, perhaps of royal stock, served in the Roman army, but is said to have deserted and to have been captured and made a gladiator. In 73 B.C. he, with a band of fellow gladiators, broke out of a training-school at Capua, and taking refuge on Mt. Vesuvius, rallied round him thousands of slaves. He defeated Claudius, sent against him with 3,000 men, and also Varenius and others, and, last of all, Manlius with 20,000 men. Spartacus tried to lead his forces out of Italy, but they would not go. Division arose, and Crassus finally conquered them. Spartacus fell in battle, and 6,000 of his followers were crucified on the road from Rome to Capua.

SPENCE, CATHARINE HELEN: Authoress and economic writer; president of the Effective Voting League of South Australia, and vice-president of National Council of Women. Born Melrose, Scotland, Oct. 31, 1825; arrived in South Australia 1839. Since 1859 the main interest of her life has been electoral reform on the Hare-Spence system of proportional representation or effective voting, and she has lectured extensively on these themes in Australia and in the United States and Canada. She has also interested herself in children of the State. Member of the State Children's Council; member of the Destitute Board; president of Woman's Cooperative Clothing Factory. Held a commission from the South Australian Government to inquire into educational, constitutional, and electoral laws, the management of benevolent institutions, and question of bimetallic currency. She has written extensively for the South Australian press since 1878, in *The Register*, *Fraser's Magazine*, *Cornhill*, *Harper's*, *Melbourne Review*, *Victorian Review*, *The Centennial*, etc. Authoress of many novels and works, including "The Laws We Live Under," with chapters on elementary political economy and duties of citizens. Address: Aveland Avenue, North Norwood, Adelaide, South Australia.

SPENCE, THOMAS: A London bookseller who advocated the "parochializing" of land "so that there shall be no more nor other landlords in the whole country than the parishes." In 1775 he read a paper on land nationalization before the Philosophical Society in Newcastle, and was thereupon expelled from the society; he was also prosecuted by the government for selling seditious literature. Among other reforms he advocated a kind of phonography. His Newcastle paper has been republished by the modern English Socialists.

SPENCE, HON. WILLIAM GUTHRIE: Member of Parliament for Darling, New South Wales, since 1901; president of the Australian Workers' Union since 1886; born Orkney, 1846; elected to Legislature of New South Wales for Cabar, 1898-1901. Secretary and organizer of Amalgamated Miners' Association for sixteen years. Address: Parliament House, Melbourne.

SPENCER, HERBERT, was born at Derby, England, in 1820. His father was a schoolmaster of original character and strong views. The boy was delicate and backward in early studies; was placed in 1833 under the care of his uncle, the Rev. Thomas Spencer, of Hinton, a clergyman of the Church of England, but of somewhat radical views, and a vigorous advocate of social reforms. In 1837 Herbert Spencer was articled to a civil engineer, and worked on the London & Birmingham Railway. In 1845, however, he moved to London and began his literary career. In 1842 he had already written, in the *Nonconformist*, a series of papers on "The Proper Sphere of Government." From 1848 to 1852 he wrote on the *Economist*, and in 1850 published his "Social Statics," the radicalism and brilliancy of which gained him friends like Huxley (*q. v.*) and George Eliot. In 1855 appeared his "Principles of Psychology," by many considered his greatest work. Already interested in the unity of sciences and in the evolutionary philosophy, he projected in 1859 an entire system of philosophy, to the development of which, in volumes on dif-

ferent portions of the subject, he has directed his life. "First Principles" appeared in 1862; "The Principles of Biology" (2 vols.); "The Principles of Psychology" (2 vols.); "The Principles of Sociology" (3 vols.); "The Principles of Ethics" (2 vols.) have followed at different periods; the last volume of the "Principles of Sociology" only appeared in 1896. In all these works he argues, with large learning and great ability, that all phenomena of matter and of mind, all motion and all force, proceed on a law of gradual development, from the general to the particular, from a simple homogeneous uniformity to a complex heterogeneous multiformity. This evolution proceeds, he argues, on laws of natural struggle for existence, of natural selection, and the resultant survival of the fittest. The same general principles he has worked out on many detached subjects, in his "The Data of Ethics" a part of his "Principles of Ethics" (1879), "Education" (1861), "The Study of Sociology" (1872), "Descriptive Sociology" (1873-78), "Justice" (1891)—several essays in which he bitterly attacks the Socialist tendencies of the day. "The Coming Slavery," "The Great Political Superstition," "The Sins of Legislators," "The New Toryism," have been collected under the title of "Man vs. The State." Died Dec. 8, 1903.

(For a discussion of Mr. Spencer's sociological views, see articles *EVOLUTION* and *SOCIALISM*.) Mr. Spencer has advocated his views with such power that he is sometimes called the philosopher of the century; but his influence is to-day distinctly waning in university circles, while his late utterances in "Justice," disowning his former position taken in "Social Statics," chap. viii., 1st ed., that equity does not allow private property in land, has much hurt his influence among the masses. His present view is that, tho absolute equity does not allow private property in land, to nationalize land without compensation would be wrong, since society has allowed private ownership, and that, with compensation, to nationalize land would do no good. In his "Social Statics," however, he asked, How long it took a wrong to grow into a right?

Many writers, like Huxley and Ritchie, have accused Spencer of inconsistency in seeing the necessity of the subordination of the part to the whole in the bodily organism, but not in the social organism (see *EVOLUTION*); but he remains a steadfast foe of all steps even tending toward socialism. (See *INDIVIDUALISM*.) The general fundamental proposition of his individualism he has thus stated:

The sphere of existence into which we are thrown not affording room for the unrestrained activity of all, and yet all possessing, in virtue of their constitutions, similar claims to such unrestrained activity, there is no course but to apportion out the unavoidable restraint equally. Wherefore, we arrive at the general proposition that every man may claim the fullest liberty to exercise his faculties compatible with the possession of like liberty by every other man (H. Spencer, "Social Statics," chap. iv.).

SPOILS SYSTEM: This is the name usually given to the custom of considering the bestowal of public offices, by the party in power, on the partisans of the party as a reward for service to the party in elections, etc. It develops rings, bosses, and corruption. (For further consideration of it, see *CIVIL-SERVICE REFORM*.)

STANDARD OF COMFORT: Many men believe that wages depend on the standard of comfort of the class of men receiving the wages.

They argue that if wages fall materially below what will enable men to maintain their "standard of comfort," they will usually strike or agitate in some way for higher wages; that, on the other hand, if wages are high enough to maintain their standard of living, they will remain usually content; and therefore, that the way to raise wages is to raise the standard of comfort, while all that tends to make living cheaper tends, other things being equal, to lower wages. (For a full discussion of this, see **SHORT-HOUR MOVEMENT**; also **EXPENDITURE**; **WAGES**.)

STANTON, ELIZABETH, née CADY: Woman suffragist and lecturer; born Johnstown, N. Y., 1815. In 1840 she married Henry B. Stanton, reformer, author, and state senator. Attending the World's Anti-Slavery Convention in London she met Lucretia Mott. Till 1847 she resided in Boston, Mass., then removed to Seneca Falls, N. Y.; in 1848 she signed with Lucretia Mott the call to the first Woman's Rights Convention, which met July 17, 1848. She devoted her life to this cause, addressing meetings, attending legislative hearings, and circulating petitions in the United States, Great Britain, and France. She canvassed Kansas in 1867, and Michigan in 1874. President of the National Association till 1892, and president of the first International Council of Women, held at Washington in 1888. Died in 1902.

STATE, THE: The State, says Professor Burgess ("Political Science and Constitutional Law," vol. i., p. 51), is "a particular portion of mankind viewed as an organized unit." With this general definition in mind we shall in this article briefly trace the development of the ideal of the State. (For actual historical development of organized society, see articles **SOCIOLOGY**; **PRIMITIVE PROPERTY**; and **FAMILY**.)

The conception of the State which first prevailed in Asia and also in Greece recognized it as a natural part of the world, and, like the world, the gift of the gods. The Asiatic kings claimed to rule by right divine, and usually to be descended from the gods. The Greek city-State was considered of divine origin. The State represented to them the moral order of the world, in which human nature fills its end. The State was not a machine, but an end in itself.

Plato says ("De Rep." v., p. 462): "The best State is that which approaches most nearly to the condition of the individual. If a part of the body suffers, the whole body feels the hurt and sympathizes altogether with the part affected." Aristotle declares that "man is by nature a political animal," and says ("Pol." iii., 9, § 14) the State is "the association of clans and village communities in a complete and self-sufficing life." "The State," he says ("Pol." i., 2, § 8), "comes into being for the sake of mere life, but exists for the sake of the good life." The Greek State is all in all. (See **ATHENS**.)

The Roman ideal follows Greek models, but with the Roman genius for jurisprudence conceives of law as the creature of the State, and the State as based on the assent of the people. Cicero ("De Rep." i., 26) says the State is "the people organized." In the Middle Ages we have Greek ideals, Roman jurisprudence, Germanic personal liberty, all blending with Christian teachings. Both Church and State are conceived as coming from God. Which is supreme? This is the problem of the Middle Ages. We have also attempts, characteristically based on the Bible precedent of the covenant of King David with the elders of Israel, to show that the State

rests on the consent of the people. We have finally Saxon love of personal liberty, placing the individual as the center and not the State, giving the germs of constitutional government. Feudalism, with its personal element, its homage and service, is the characteristic form. Gradually from this develops the centralized State, and Machiavelli at the beginning of modern times concerns himself with the policy of kings. Bodin sees in the State "a right government, with sovereign power, of several households and their common possessions." Grotius calls the State "the complete union of free men who join themselves together for the purpose of enjoying law and for the sake of public welfare." This is the transition to the contract theory. With Protestantism and the dawn of modern freedom the individual is sovereign. The State is a compact between sovereign individuals. With Hobbes, however, individuals have contracted with each other to give over their rights to some sovereign power, and henceforth, having given over their rights, must absolutely obey the sovereign. He says ("Leviathan," Morley ed., p. 84):

The State is established by a covenant of every man with every man in such manner as if every man should say to every man, "I authorize and give up my right of governing myself to this man or to the assembly of men on this condition, that those give up their right to him and authorize all his actions in like manner." This done, the multitude so united in one person is called a commonwealth, in Latin *civitas*. This is the generation of that great "leviathan," or rather, to speak more reverently, of that "mortal God" to which we owe, under the immortal God, our peace and defense."

With Locke the State is also the result of a contract, but the individuals retain their sovereignty and we have constitutional government, and the people can judge the king. Rousseau carries the doctrine of individual sovereignty, of the social contract, and of natural rights to their logical extremes, and leads us to the French Revolution. (See **NATURAL RIGHTS**.) In America the same doctrine has led to the various bills of right and the limitation of government to that which the people expressly allow the government to do in their charters and constitution. The result is the tying of the hands of legislation by the dead hand of constitutions framed for other days and only with the greatest difficulty to be changed. (See **CONSTITUTION** and **CONSTITUTIONALISM**.)

Revolting from the results of the French Revolution, the historical school denied that the State was in any such sense the result of a contract. Savigny ("System des röm. Rechts," i., p. 22) calls the State "the bodily form of the spiritual community of the nations," or "the organic manifestation of the nation." Burke says ("Reflections on the Revolution in France"):

Society is indeed a contract. Subordinate contracts for objects of mere occasional interest may be dissolved at pleasure. But the State ought not to be considered as nothing better than a partnership agreement in a trade of pepper and coffee, calico or tobacco, or some other such low concern, to be taken up for a little temporary interest, and to be dissolved by the fancy of the parties. It is to be looked upon with other reverence, because it is not a partnership in things subvenient only to the gross animal existence of a temporary and perishable nature. It is a partnership in all science, a partnership in all art, a partnership in every virtue and in all perfection. As the ends of such partnership cannot be obtained in many generations, it becomes a partnership not only between those who are living but between those who are living, and those who are dead, and those who are to be born. Each contract in each particular state is but a clause in the great primeval contract of eternal society.

Buckle strives to explain the State by a consideration of the forces of nature. The Germans

have developed a more ideal conception of the State. Kant calls it "a collective being" ("Werke, ed. Rosenkranz," vii., 197). Hegel says: "The State is the realization of the moral idea. It is the moral spirit as substantial will." Bluntschli, uniting the German idealism and the modern historical view, says ("The Theory of the State" tr., bk. i., chap. i.): "The State is a combination or association of men, in the form of government and governed on a definite territory, united together into a moral organized masculine personality; or, more shortly, the State is the politically organized national person of a definite country." The present tendency in England and America is to discard all abstract theories of natural rights and to ask what is the actual content of the State idea. Hence Professor Burgess's definition, as quoted above, "A particular portion of mankind viewed as an organized unit."

Bluntschli finds as necessary to the concept of a State (1) a number of men, (2) a fixt territory, (3) unity, mainly developed by history, (4) an organic nature, (5) a moral and spiritual character, (6) a masculine personality. He says, "The highest conception of the State—which, however, has not yet been realized—is humanity organized."

Professor Burgess ("Political Science and Comparative Constitutional Law," vol. i.)

considers as "the peculiar characteristics of the organization which we call the State," (1) that it is all-comprehensive. "Its organization embraces all persons, natural or legal, and all associations of persons." (2) It is exclusive. "Political science and public law do not recognize the existence of an *imperium in imperio*." (3) It is permanent. "It does not lie within the power of men to create it to-day and destroy it to-morrow, as caprice may move them." (4) The State is sovereign. "This is its most essential principle."

Concerning sovereignty Professor Burgess says:

I understand by it original, absolute, unlimited, universal power over the individual subject and over all associations of subjects. This is a proposition from which most of the publicists down to the most modern period have labored hard to escape. It has appeared to them to contain the destruction of individual liberty and individual rights. . . . They do not sufficiently distinguish the State from the government. They see the danger to individual liberty of recognizing an unlimited power in the government, and they immediately conclude that the same danger exists if the sovereignty of the State be recognized. . . . The unlimited sovereignty of the State is not hostile to individual liberty, but is its source and support. Deprive the State, either wholly or in part, of the power to determine the elements and the scope of individual liberty, and the results must be that each individual will make such determination, wholly or in part, for himself; that the determinations of different individuals will come into conflict with each other, and that those individuals only who have power to help themselves will remain free, reducing the rest to personal subjection. . . . No State has made liberty so full and general as the modern national popular State. Now the modern national popular State is the most perfectly and undisputedly sovereign organization of the State which the world has yet attained.

Concerning the forms of the State Aristotle found three primitive forms, monarchy, aristocracy, and "polity." He uses democracy only in a bad sense, the three perversions of the State being with him tyranny, oligarchy, and democracy or ochlocracy. Others have added "the mixed State." (See POLITICAL SCIENCE.)

STATE RIGHTS: From 1789 to 1870 the question of state rights, or the question of the rights of the respective states of the United States in reference to the federal government, was a burning question. (For a discussion of the history, see CENTRALIZATION; also CONSTITUTION.) In 1830 occurred the celebrated debate between Mr. Webster and Mr. Hayne upon this question, and South Carolina claimed the right of nullification. This led eventually to secession and the

war of 1861-65, which settled the doctrine, in most respects, at least, against the believers in state sovereignty if not in state rights.

Says Mr. James Bryce ("American Commonwealth," 1st ed., chap. xxxvi.):

What, then, do the rights of a state now include? Every right or power of a government except:

The right of secession (not abrogated in terms, but admitted since the war to be no longer claimable. It is expressly negated in the recent constitutions of several Southern states).

Powers which the constitution withholds from the states (including that of intercourse with foreign governments).

Powers which the constitution expressly confers on the federal government.

STATISTICS: The science of statistics, strictly speaking, has no more place in an encyclopedia of social reform than a discussion of grammar or arithmetic. Yet statistics are not only so continually used in social reform discussion, but so frequently misused, that a brief statement of the generally accredited correct use of statistics seems practically necessary. So important indeed are statistics in social study that Professor Marshall has called statistics the straw out of which the economist has to make his bricks. ("Evidence to the Committee on the Census," 1890.) Yet half-baked bricks weaken a large proportion of economic structures. In this article we only, however, give general principles, since the history and details of the science are not our field. We abridge these principles from a recent statement of one of the highest modern authorities in the science, Prof. A. L. Bowley (in the Introduction to his "National Progress in Wealth and Trade"). He says in brief:

(a) Statistics must cover the whole field of inquiry. If

statistics cannot be made complete, or at least if we cannot be sure that the part neglected is unimportant, we can establish no positive assertion; partial statistics are suitable only for party purposes.

(b) All statistics used must be closely related to the quantity whose change we wish to examine. Trade prosperity is not sufficiently tested by the traffic on railways or by clearing-house returns; the stress of poverty is not measured by the returns of pauperism. Such estimates are only enough to indicate the probable course of change, and to throw the burden of proof on those who allege that the tests are insufficient.

(c) When dealing with a quantity which fluctuates year by year, no judgment can be formed without examination of the records of a long series of years. Thus prices of wheat and of other commodities fluctuate violently, and it is only after a long period that it can be ascertained whether there is a permanent change of level. Most statistics relating to trade are subject to alternate expansion and contraction, and it is only by looking at the figures year by year for a long period that the rate of progress can be estimated.

(d) The purchasing power of gold is continually changing and it is always necessary to examine statistics relating to the value of goods to tell whether an argument will be affected if we express the facts in quantities instead of in value. Thus statements as regards money wages are of little utility till we know how retail prices are changing. Apparent increases of exports or imports are often attributable to the inflated price of particular commodities. The apparent relative growth of the trades of two nations often has quite a different aspect when we look at their quantities instead of their values.

(e) Before the change in a total is used as significant, it must be considered whether the various groups which compose it are of the same nature, or whether a change in one part has masked a change in the opposite direction in the other. The degree of similarity requisite depends entirely on the problem considered. The question should always be put: Is the total (or average) computed from items whose dissimilarity in any respect can affect the problem in hand?

The result often is that it is found that no definite conclusion can be drawn. It is humiliating to have to admit that our positive knowledge is so limited, and it is natural to ask whether more cannot be done in the way of official inquiry or private investigation. There is doubtless a wide field for the latter, but the unofficial student is constantly handicapped by the absence of essential data which the government only can collect.

STEAD, WILLIAM THOMAS: Editor of *English Review of Reviews*; born 1849, at Embleton, Northumberland; son of a Congregational minister; left school at fourteen; in 1871 was editor of *Northern Echo*, Darlington, the first halfpenny morning paper in England; 1880-83 was assistant editor of *Pall Mall Gazette*, becoming its editor in 1883. Left the *Gazette* in 1890 to found the *Review of Reviews*. Three months in jail for technical breach of the law committed in securing the raising of the age of consent for girls from thirteen to sixteen years. A reform in this regard was secured by the publication of "The Maiden Tribute of Modern Babylon." Took prominent part in the Conference at The Hague in 1889. Traveled extensively in the United States. For four years edited *Borderland*; issued "Penny Poets" and "Books for the Bairns." Mr. Stead confesses himself a free trader, and as much of an imperialist and Socialist as is compatible with a due regard to common sense and the Ten Commandments. Author: "Truth About the Navy"; "Maiden Tribute of Modern Babylon"; "The Truth About Russia"; "The Pope and the New Era"; "If Christ Came to Chicago"; "The United States of Europe"; "The Americanization of the World"; "The Best or Worst of Empires, Which Shall It Be?" He edited the *Courier de la Conférence*, a daily for four months during The Hague Conference in 1907. Address: Mowbray House, Norfolk Street, Strand, London.

STEADMAN, WILLIAM CHARLES: English Labor M. P.; born 1869; apprenticed as a lad to the barge-building trade, he pursued that calling until 1892 when he was elected a member of the London County Council. Secretary of Barge Builders' Union since 1882. In 1890 he successfully managed a strike for better conditions. In 1898 he was elected to Parliament for Central Finsbury, and again in 1906 (Liberal and Labor). He was president of the Trade-Union Congress 1902, and secretary, and in 1905 president National Housing Council. Address: 49 Rectory Square, Stepney, London, E.

STEIN, HEINRICH FRIEDRICH KARL, BARON VON: Prussian statesman; born in Nassau, 1757. Studying at Göttingen, from 1773 to 1777, in 1780 he entered the service of Prussia as an official in the mining department. Rising in office, was made in 1804 Minister of State. Abolished serfdom and internal custom duties in Prussia, and introduced other reforms which largely paved the way to German unity. Frederick William III. dismissed him in 1807 on account of his criticism of the royal policy, but was obliged to recall him to office six months later, till Napoleon compelled the king to finally dismiss him. In Russia and in Germany, however, Stein worked against Napoleon, and after Napoleon's downfall Stein became president of a central commission to administer the lands occupied by the allied armies. After this he refused an office and lived in retirement in Frankfurt and Westphalia till his death in Westphalia in 1831.

STEIN, LORENZ VON: Political economist; born Eckernförde in 1815. Raised in orphanage, but was enabled by Frederick VI. to study at Kiel and Jena. Traveling in France, he met in Paris Cabet, Louis Blanc, Reybaud, and other Fourierist Socialists; published in 1844 "Der Sozialismus und Kommunismus des heutigen Frankreich." In 1846 he became professor at Kiel, and published various books, among others his "System der Staatwissenschaft." In 1852 he lost his position, but in 1855 became professor of political economy at Vienna. Here he published, among other writings, "Lehrbuch der Volkswirtschaft," "Lehrbuch der Finanzwissenschaft," and above all his great "Die Verwaltungslehre" (7 vols.), which were long an authority in administrative science. He died in Vienna in 1890.

STELZLE, CHARLES: Presbyterian clergyman; superintendent of the Department of Church and Labor in the Presbyterian Church; born 1869 in New York City. Attended schools of the city, but began to be breadwinner at eight years of age. In his eleventh year gave up school altogether and worked at various occupations. Apprenticed at fifteen years to learn the machinist's trade with the firm of R. Hoe & Co. Employed at this work for eight years. During that time, at evening schools of the city and under private tutors, gained what was practically a college education. Convinced by his experience among the 2,000 men in the machine-shops of the slight hold the Church had on the working men, resolved to enter ministry for the express purpose of winning such men for Christ and the Church. Studied for a year at the Moody Bible Institute, Chicago; became pastor of a church among working men in Minneapolis. Had pastorates afterward in New York City and in St. Louis. Then called to his present work as superintendent of the Department of Church and Labor of the Board of Home Missions in the Presbyterian Church in the United States of America. Mr. Stelzle, as a trade-unionist, calls himself an opportunist. He is convinced that the social problem will never be settled except upon a moral and religious basis; believes that the Church has an important part in the solution of this question, and that it should have a clear, clean-cut message concerning the every-day needs of the common people. He writes regularly a syndicate article for the labor press of the country, which is published in about 300 papers. Author: "The Working Men and Social Problems"; "Boys of the Street, How to Win Them"; "Messages to Working Men"; "Christianity's Storm Center: A Study of the Modern City." Address: 156 Fifth Avenue, New York City.

STEPHENS, URIAH SMITH: Founder of the Knights of Labor; born near Cape May, N. J., 1821; educated for the Baptist ministry, but was compelled to learn a trade; became a tailor. He taught school and traveled extensively, but mainly followed his trade in Philadelphia. In 1869 he was the main founder of the Knights of Labor (q. v.), the first Master Workman of Assembly No. 1, and in 1873 was chosen the first Grand Master Workman. He died in 1882.

STEPNIAK, SERGIUS MICHAEL DROGO-MANOFF: Russian radical; born in the Ukraine Mountains in 1841. Studied at Kieff, and became a teacher of history there; professor in 1870; re-

moved by the government in 1876, and driven into exile, because of his strictures on Count Tolstoi. He had written works, as early as 1862, which had been published, and he now went to Switzerland and wrote in the Little Russian dialect against absolutism and for democracy in Russia. In 1885 he removed to London, and became a leading authority on Russian subjects, and a steady worker for social and political reforms. He died in London, 1895. Author: "Underground Russia"; "The Career of a Nihilist"; and numerous other works.

STEVENS, LILLIAN M. M.: President National Woman's Christian Temperance Union; born 1844, at Dover, Me.; educated at Foxcroft Academy; a teacher in the schools of Maine until her marriage. In 1874 assisted in the organization of the Woman's Christian Temperance Union of Maine, was its first treasurer, and afterward its president. From 1894-98 was vice-president of the National Union; after the death, in 1898, of Miss Willard, became the acting president, and on the meeting of the National Convention at St. Paul that same year was herself elected to the presidency; reelected every year since. Vice-president of the World's Woman's Christian Temperance Union. One of the managers of the World's Columbian Exposition, 1892-93; was for years representative for Maine in the National Conference of Charities and Correction. Mrs. Stevens believes in one standard of purity for men and women; that total abstinence from intoxicating liquor is the only safe and beneficent course. She also firmly believes that state and national prohibition of the liquor traffic would greatly help toward the settlement of all other reform questions. Address: Portland, Me.

STEWART, IRA, "Father of the Eight-Hour Philosophy," was a workingman of English birth, who, with Mr. George E. McNeill and others, founded the Boston Eight-Hour League. Mr. Stewart's thoughts have been best developed by one whose position, in many ways, was opposed to his, namely, by Mr. Gunton (*q. v.*) in his book on "Wealth and Progress." (See EIGHT-HOUR MOVEMENT.)

STEWART, JAMES DENHAM: Metaphysician; economist; born Edinburgh, 1712. Educated at the University of Edinburgh, entered the law, spent some time on the Continent. He became so involved and compromised by his relations with the Pretender to the throne that he was unable to return to Scotland, but was obliged to remain on the Continent from 1745 to 1763. He published in 1767 "An Inquiry into the Principles of Political Economy," the best known of his many writings. His complete works, political, metaphysical, and chronological, were collected and published by his son in 1806. Died in Lanarkshire, 1780. (See POLITICAL ECONOMY.)

STIRNER, MAX: Pseudonym of Kaspar Schmidt, an extreme individualist writer of Germany, born Bayreuth, 1806; studied at Berlin, Erlangen, and Königsberg, first theology, then philosophy. Spent his life as a teacher, but was always a student. He wrote in 1845 "Der Einzige und sein Eigentum" (The Individual and His Property), a book which most philosophic anarchists consider one of the earliest and ablest

statements of their views. Died at Berlin in 1856. (See ANARCHISM.)

ST. LOUIS: Situated, as it is, near to the center of population in the United States, is in many respects at once a Northern, Southern, Eastern, and Western city, the center of vast railroad interests and of great wealth, yet with a population more complex than even most American cities, and has had more than her share of intricate social problems. Founded as a fur-trading center in 1764, first French, then Spanish, then French again, ceded to the U. S. by the Louisiana Purchase Act of 1803, chartered in 1822, growing rapidly after 1830, her emigration since 1850, owing largely to the revolutionary movements of 1848, has been chiefly German. Of her present population, 575,238 in 1900, tho the foreign-born are comparatively few, nearly one half are born of foreign parents, while of the foreign-born more than one half came from the German Empire. Since the war, too, a large colored population has developed, altho probably during the war the sympathy of a majority of the citizens was with the South, and the city was only saved to the North by the wise energy of a minority. Since the war, too, the city has become the center or starting-point of such vast railroad systems like the Gould system, and the abode of so much wealth growing out of its vast commerce, that it is small wonder that commercialism, playing on such a complex and often irresponsible population, has developed political and industrial scandals and made the city somewhat notorious for this. Into this, however, in this article we need not go. It is covered in the article CORRUPTION. At present there seems good ground for believing that the city's government is largely redeemed from its worst evils. The municipal government is vested in a House of Delegates representing the wards, a Council or Upper House with a more general representation, and a mayor with departments under him. The mayor appoints only the heads of the lower departments, and those of the more important ones are chosen by direct vote of the people. The sheriff, civil and criminal judges, with the police, however, belong to the county, except that the mayor appoints justices for the police courts. The police are under the final authority of the governor, but are directed by commissioners whom he appoints, and the expenses are met by the city treasury. The schools are under a board elected by popular vote—a complicated system making the fixing of responsibility difficult and reform uncertain. Public ownership and control extend only to the water-supply, streets, sewers, parks, and schools. (For statistics, see CITIES.) The city is more commercial than manufacturing, altho there were in 1900 6,732 manufacturing establishments in the city (without its suburbs East St. Louis or others), with an annual product of \$233,629,000, of which tobacco, food, and malt products are the principal. Its annual sales are approximately: dry goods, \$120,000,000; groceries, \$75,000,000; boots and shoes, \$50,000,000; tobacco, \$41,000,000, making it "the largest tobacco market in the world." The clearings of the banks and trust companies are some \$3,000,000,000 per year.

The relief institutions include a city dispensary, city hospital, other hospitals, insane asylum, poorhouse, house of refuge, reform school and prison, and a juvenile court. A school of

Philanthropy has recently been established. (See SCHOOLS OF PHILANTHROPY.) An active Y. M. C. A., a public library, numerous Turner societies and clubs, several institutional churches and settlements carry on the social life of the city. The Civic Federation is the main society of civic reform, but clubs and societies represent almost every phase of reform thought. St. Louis seems entering on a period of good government, the administration of Mayor Rolla Wells, the reform mayor, being without scandal, altho the enemies of reform are numerous and daring. The important social reform societies are all well organized, e. g.:

The Civic Federation, 319 N. Fourth Street.
Young Men's Christian Association, Grace and Franklin.
St. Stephen's House, Sixth and Rutgers Streets.
The Women's Christian Temperance Society.
Central Trades and Labor Union, 925 Franklin Ave.
Socialist Party of Missouri, 324 Chestnut Street.

STOCK EXCHANGES began in the creation of public debts on the modern plan late in the seventh century, but there was no formal organization of stock-brokers. The New York Stock Exchange was formed in 1792 by twenty-four brokers, but did not have a building till 1865. The London Stock Exchange (Capel Court) building dates from 1801; that of Paris from 1826. To-day by far the four greatest stock exchanges are those of London, Paris, Berlin, and New York. In the amount of wealth converging on the investment market and in world exchanges, London probably stands first; in the amount of actual money Paris is perhaps first; in the amount of transactions New York is by far ahead. Says Mr. A. D. Noyes (*Munsey's Magazine*, 1907, p. 596):

In 1905 there were sold on the New York Stock Exchange 263,000,000 shares of stocks and over \$1,000,000,000, face value, in bonds. If the average price of the stocks—a rough estimate—was \$70 per share, and if the price of the bonds averaged par, it will be seen that some \$19,500,000,000 worth of capital was paid over last year for securities purchased on the floor of the Exchange. On one day—April 30, 1901, the climax of the Wall Street speculative craze of that extraordinary year—3,200,000 shares of stock changed hands. This, on the average price above assumed, meant that \$224,000,000 worth of that class of securities alone was purchased in that single day.

There is no reason to suppose that transactions on any European stock exchange come within a fraction of these figures. None of the foreign markets pursues such a thorough system of reporting as our own; but the facts may be judged from what is considered a large sale in one market or in another. On a European market sale of single blocks of 1,000 shares of standard stocks are rare; on the New York Stock Exchange they are so familiar as to attract no special attention. The list of securities dealt in on the London Stock Exchange is much longer than that of the New York institution, but an active day causes no such pressure on the machinery of the institution as is exerted in New York. Except for the system of "clearing" stocks—placing the value of securities bought by one broker against the value of securities sold, and leaving only the difference to be paid in cash—the banking and credit facilities of New York could not possibly endure such a daily strain, while providing for commercial customers. Even with the "clearing" system, the demand on the loanable funds of New York banks, at times of a stock-exchange "boom," is so great as to lead repeatedly to the extraordinary rates for money of which so much has recently been said.

One reason why stock-exchange business at New York so far surpasses that of the European exchanges, is that a far larger portion of the Wall Street purchases and sales are purely speculative. It has been estimated that less than 10 per cent of the stocks bought on the New York exchange are bought by investors to keep. The rest are bought to sell again as soon as the expected rise has come. Profits made on the frequent advance in prices, during the epoch of American prosperity since 1898, have been so great as to dazzle the speculative mind.

European banks will not lend on such a scale to stock-exchange speculators, and European speculators will not take such risks. It is part of the American character that reckless gambling chances of the sort are coolly accepted. When Wall Street has gone too far, and is in a scrape—as in the

"rich men's panic" of 1903, and in the smaller convulsion after the earthquake of 1906—it resorts to London, Paris, and Berlin to borrow money, and, at a price, it gets it. There is always capital to be had on these slow-going foreign markets. (See WEALTH.)

STÖCKER, ADOLF: German Protestant Christian Socialist leader, and director of the *Stadt Mission* in Berlin, member of the Reichstag, and of the General Synod of the State Church of Prussia; born Dec. 11, 1835, at Halberstadt. He received his preparatory training at the Bürgerschule and Gymnasium of his native city; studied theology and philosophy at Halle and Berlin, 1856; was successively tutor and pastor in Neumark, Kurland, Seggerde, Hamersleben from 1857 to 1870. He became army chaplain in Metz in 1871, and in 1874 court preacher at Berlin until 1890. In 1877 he was the main leader in establishing Protestant Christian socialism in Germany. For an account of this, see CHRISTIAN SOCIALISM, but it must be remembered that Christian socialism on the Continent has not at all meant the radical movement it has usually meant in England and America. Especially under the lead of Stöcker it has meant little more than the religious wing of the paternal movement for the State and the Church to aid the poor. Stöcker has been even better known as a leader in the German anti-Semitic movement. In 1881 he was elected to the Reichstag for 1881 to 1893; but was reelected in 1898 and since. Author: "Christliche soziale Reden und Aufsätze" (1890); "Christlich Sozial" (1890); editor of *Deutsch Evangelische Kirchenzeitung*; "Wach auf! evangelisches Volk"; "Kirchenpolitische Aufsätze," 1901; "Dreizehn Jahre Hofprediger und Politiker," 9th ed.; and numerous essays in periodicals, besides purely religious works. Address: Berlin, S. W., Königgratzer Strasse, 46.

STONE, LUCY: Woman suffragist; born West Brookfield, Mass., 1818. Taught school to earn money for a higher education; in 1847 graduated at Oberlin College. The same year she gave a lecture on woman's rights in her brother's pulpit at Gardner, Mass., and soon was engaged to lecture for the Anti-Slavery Society, in which work she had great success. In 1855 married Henry B. Blackwell, but always retained her own name. In 1866 she helped to organize the American Equal Rights Association, and in 1869 the American Woman's Suffrage Association, of the executive board of which she was chairman for twenty years. She died in 1893.

STOWE, MRS. HARRIET BEECHER: Author of "Uncle Tom's Cabin"; born Litchfield, Conn., 1812, daughter of Dr. Lyman Beecher and sister of Henry Ward Beecher (q. v.). Studied at home and in Hartford Female Seminary, where, too, she taught from 1827 to 1832. Her father becoming president of Lane Theological Seminary in Cincinnati, she moved there with him, and, in 1836, married there Prof. C. E. Stowe. They lived there till 1850, when her husband became professor of theology in Bowdoin College, Me. In 1852 he accepted a professorship at Andover, Mass., which ill health compelled him to resign in 1862. Mr. and Mrs. Stowe went to reside in Hartford, Conn. "Uncle Tom's Cabin" was written first as a serial for *The National Era* of Washington, and was based on incidents with which Mrs. Stowe became acquainted in her life in Cincinnati. March 20, 1852, it was published as a book, and 300,000 copies were sold in a year;

forty editions appeared during the year. It has been translated into nearly twenty languages, and probably contributed more than any other one effort to rousing the country against slavery. In 1853 Mrs. Stowe visited Europe and wrote "Sunny Memories of Foreign Lands." In 1856 she wrote "Dred," another slave story. Among her other numerous tales are "Old Town Folks"; "My Wife and I"; "Men of Our Times." Mrs. Stowe died in Hartford, July 2, 1896.

STRAIGHT EDGE INDUSTRIAL SETTLEMENT, THE: Started in New York City in 1899, under the title of "A School of Methods for the Application of the Teachings of Jesus to Business and Society." It grew out of the desire of Mr. and Mrs. Wilbur F. Copeland to make their home a center for the study of social and industrial problems. *The Straight Edge*, a weekly newsletter started in 1899, gave its name to the movement, which, during its first seven years of experimental work, has enabled over two hundred persons—about eighteen at a time on an average—to earn their living by carrying on simple industries, such as a bakery, restaurant, pure-food laboratory, printery, laundry, dressmaking, gardening, and other branches for which from time to time it has had qualified workers. Its purpose is to find men and women who need work and to organize them into useful, self-supporting, cooperative industries. Each worker, after working two months on trial, is given a grade based on ten industrial qualifications, and shares in the earnings of the industries in proportion to his grade. The ten qualifications on which a worker is graded are that he:

1. Does useful and necessary work that adds to the industrial efficiency of the organization, and as much of it as could reasonably be expected from a thoroughly trained worker with the best equipment.
2. Puts in the time and energy necessary to do to the best of his ability all the work for which he becomes responsible.
3. Knows how to set himself to work and to keep at work without needless supervision.
4. Carries responsibilities continuously, never throwing his work on somebody else, or leaving it without arranging to have it done properly.
5. Requires no waiting on; is willing to do anything there is to be done.
6. Cleans up after himself; leaves his working-place in order; is clean about his work and in his personal habits.
7. Takes care of the tools and utensils with which he works.
8. Works in harmony with others; shows respect for his fellow workers and consideration for their rights, convenience, and comfort.
9. Attends the business conferences; watches the economies of the place; saves materials and expense; makes and helps to carry out helpful suggestions.
10. Has worked long enough to earn the proportionate share of working capital required on an average to furnish a first-class industrial opportunity for each cooperative worker.

The custom is to grade each adult worker who stays the two months on trial and wishes to continue, "36 points," or four points on each of the first nine qualifications, if there is no objection raised when the name is proposed, in open meeting of the workers, to be placed on the regular list. Then each month the grade of each worker is considered in the same way, and an additional point is given to each, if proposed by a fellow worker on some specific qualification and no objection is raised.

A primary industrial training department, known as the "Play-work School," is maintained for the children of workers and for any other children whose parents or guardians wish to pay for the service what it is worth. The children re-

ceive "points" as soon as they learn to do some useful task that contributes to the industrial efficiency of the enterprise. The children fold papers, stitch booklets, cook their food, wash their clothes, and do other ordinary work that they should know how to do for themselves.

Workers are not required to furnish capital, but a portion is laid aside from the general earnings to extend the plant, and bonds are issued in return for capital furnished, to be paid at the rate of 10 per cent a year, the issue of bonds being limited to \$500 per worker employed, and \$1 a week being laid aside for each \$500 of bonds outstanding. This enables workers to pay for their capital—land, tools, machinery, things to work with—by a very moderate tax upon their earnings. The settlement is located at 1 Abingdon Square, New York City, and has a country place near Alpine, Bergen Co., N. J.

WILBUR F. COPELAND, *General Organizer*.

STREET-RAILWAYS. (See also PUBLIC OWNERSHIP; STOCK-WATERING.)

THE UNITED STATES

Electric-railway lines in the United States are increasing rapidly. In 1890 there were 8,123 miles of track and in 1902 22,576 miles. In the same period the number of employees increased from 70,000 to 140,000. Upon some interurban lines the speed and equipment are so good that the electric-car competes with the steam-car.

The equipment and improvement of electric lines is causing important social changes. First, urban population is being better distributed; for example, the population of the Bronx and outlying parts of New York City increased from 88,900 in 1890 to 200,000 in 1900. Second, suburban life around all great cities has been increased with the consequent increase of land values and in some instances the decrease of land values in old residential sections. Third, a concentration of business has been made possible; retail districts, for example, in the central parts of the cities, being easily accessible, absorb nearly all the trade. Fourth, easy access to the country parks and pleasure resorts adds health and enjoyment to the lives of wage-earners.

The combined total capital stock and funded debt of all street- and electric-railways is equal to \$103,090 per mile of track owned by them; the net capitalization of those companies which operate primarily electric surface railways and which do no commercial lighting, amounts to \$92,114 per mile of track. These figures greatly exceed the capitalization per mile of the steam-railways of the country, the net capitalization of which, according to the Interstate Commerce Commission, is about \$36,000 per mile of track.

It is quite impossible to obtain accurate information as to the actual amount of money which has been spent in the construction and equipment of street-railways in general, or of most individual street-railways. The item, "cost of construction," according to the books and balance sheets of street-railway companies, gives no idea whatever of the cash investment. The intervention of construction companies composed of the promoters of the railway has in many cases rendered the book value of property misleading. The most important difficulty, however, is that the

Capitalization

greatest railway systems now existing have been built up by combination and recombination.

The heaviest net capitalization is in Greater New York, where each mile of street-railway is represented by more than \$260,000 of securities. The surface lines in Manhattan were capitalized in 1902 at \$494,399 per mile of track, the highest average for any improved surface system, although some of the trackage is operated by animal power.

There is not a wide variation in the wages of most employees on electric surface railways. Of all wage-earners on such railways, 32.7 per cent received between \$2 and \$2.04 per day, while 68.8 per cent received between \$1.75 and \$2.49 daily. The rate of \$2 per day is more common

Wages

than any other, and is probably the precise median for all classes combined. More than four fifths of all conductors and five sixths of all motormen received \$1.75 or more per day, while less than 2 per cent of other classes received \$2.50 and more per day.

The only states in which a median for all wage-earners combined exceeded \$2.10 per day are Montana, California, Colorado, Oregon, and Rhode Island.

The median wage for all employees of the fast, long interurban railways is \$1.90 and \$1.94, or somewhat less than the median for all classes of railways combined. The median rate for conductors and motormen on such interurban railways, however, is \$2 and \$2.04.

Street-railway companies, like other corporations, derive their charters, which give them the right to exist and which regulate in a general way their internal government, from the state, either through general or special statute. The privilege of occupying a specific street or highway

Franchises

usually requires further authorization, and it is this authorization which is designated by the term "franchise" in the more limited sense. In some state constitutions the legislature is expressly prohibited from granting the use of the streets and highways without the consent of the local governing authorities, while in nearly all other states the practice of the legislature is to give the local governments control in this respect. This control involves ordinarily the right of the local authorities to impose such conditions as they may see fit at the time the franchise is granted. Deviations are mostly confined to the New England states, where a large proportion of the street-railway companies have been chartered by special acts of the legislature.

The movement in favor of "direct legislation" has led to the requirement, in various states and cities, that franchises shall be submitted to popular vote, either in all cases, or on petition of a certain proportion of the voters. Such use of the referendum is most common in the Western states. In Colorado, South Dakota, and Utah, for example, all municipal ordinances are subject to the referendum on petition, or the optional referendum as it is commonly called. The same requirement is found in the San Francisco charter, and in the charters of various other cities. In Nebraska and Arizona all public franchises in cities must be submitted to popular vote; in Montana and Colorado to the vote of the tax-paying electors. In Iowa one fifth of the voters in any city may require any franchise to be submitted to popular vote.

During recent years it has become quite com-

mon, with a view to obtain more favorable terms, to offer franchises at public competition. This requirement often applies to other classes of public utilities as well as to street-railways. In California, Nevada, Kentucky, and Virginia the general state laws require competitive bidding, but contain no provision specifying the character of the bids, which apparently might, at the discretion of the local authorities, be either in the form of lump sums or of annual payments. In New York and Louisiana the bids must be on the basis of a percentage of the gross annual earnings. In Ohio the franchise must be granted to the bidder offering the lowest rates of fare. A similar method is required by the individual charters of certain cities, and in a few it has been adopted voluntarily by local authorities. The city ordinarily reserves the right to reject all bids.

State constitutions or laws usually, though by no means always, limit the duration of corporate charters of all classes. Such limitations, however, are ordinarily of a formal character, and unless some action to the contrary is taken by the state legislature at the time of expiration, a charter can usually be renewed by a simple procedure on the part of the stockholders of the corporation. Nevertheless, the limitation on the duration of the charter offers to the state the

Duration of Franchises

possibility of imposing new restrictions if it so desires. State constitutions or laws seldom reserve to the state or local authorities the right to terminate a franchise, or to revise its provisions during the prescribed term, nor have the local authorities in granting franchises ordinarily reserved this right. The most important exception to the statement just made is found in Massachusetts. For a long time it has been the policy in that commonwealth to grant street-railway and other franchises for an indefinite term, subject to revocation either by the state or by the local governments.

Many street-railway franchises, particularly those of early date, are perpetual, and there is no state or local provision under which they can be revoked or amended. Where, however, a corporation whose charter is subject to revocation or amendment holds such an unlimited franchise, the state legislature can virtually annul it, or change the terms of the franchise, through its control over corporate existence. Even if both the charter and the franchise of a public-service company are unlimited in duration, the state may, subject perhaps to certain self-imposed limitations, exercise, directly or through local governments, its right of eminent domain to purchase the property for public use. The payment in such a case would ordinarily include not merely the tangible value but the full franchise value. In Indianapolis, Ind., and Portland, Ore., where competitive bidding for the renewal of franchises is required, it is especially provided that, if the grant is made to another person or corporation, the new grantee must buy the tangible property of the former holder at its appraised valuation. The same requirement is probably intended in the Virginian law and in the Baltimore charter, by which competitive bidding is also required. An arrangement of this sort has the great merit that it largely removes the discouragement to improvements which is otherwise characteristic of limited franchises.

The rate of fare on about two thirds of the urban street-railways in the U. S. is five cents

for any distance covered by a single car. The journey is often extended by means of transfers to other cars, a practise which will be fully discussed in the succeeding section. The practise, very common in Europe, of grading fares according to distance does not exist in any proper sense in American cities. In some cases the restrictions on transfers are such that certain journeys within the city's limits can be accomplished only by paying two fares. Naturally this is usually the case where different parts of the city are served by distinct companies. The most conspicuous illustration is in Chicago, where the railway systems of the south, west, and north sides are operated as independent units. The

Fares one-city one-fare principle is being strongly urged for Chicago. Consolidation of street-railways has already virtually brought this about in most cities. American street-railway managers very generally maintain that the uniform fare is more advantageous to the public than fares graded according to distance.

The returns made to the Bureau of the Census show that more than one third of all the operating street-railways in the U. S. offer fares of less than five cents to all of their patrons under certain conditions. In almost all such cases the cash fare for a single trip is five cents, but tickets for a number of trips are sold at reduced rates. Sometimes these tickets are good only during the busy hours of the morning and evening. More than 200 railway companies offer tickets at a price of approximately four cents each. By far the most common practise among such railways is to sell 6 tickets for twenty-five cents. Sometimes a further reduction is made if a larger number of tickets is bought, 25 tickets being sold frequently for \$1, and sometimes 26 or even more.

A more important practise is that of granting reduced fares to school children. In such cases the most common rate is two cents and a half, tho sometimes three or four is charged. In New England it is almost universal for street-railways to carry school children at reduced rates. About sixteen of the street-railway companies of Massachusetts reported reduced fares for working men, the most common rate being two cents and a half, altho several railways reported three or four cents. The most important company which makes special rates for working men is the Boston & Northern Railway Company, which serves many cities and towns in eastern Massachusetts. Among other instances of reduced fares for working people may be mentioned the practise of certain railways in the mining districts of Pennsylvania. For example, two companies centering at Shamokin, and several others elsewhere, sell thirty working men's tickets for \$1. The Detroit & Port Huron Shore Line and the Saginaw Valley Traction Company sell eight tickets for twenty-five cents to working men, while the railways of Zanesville, Ohio, and Clinton and Dubuque, Iowa, make a two-cent-and-a-half rate.

The fact that transfers were issued to more than one fifth of the fare passengers on street-railways in 1902 indicates the great importance of this practise in connection with the social service of street-railways.

Transfers The proportion of passengers who transfer is highest in the large cities, where the railway lines are complex and where the distances to be covered are great. An examination of the detailed statistics for individual companies shows that there is scarcely an important surface railway in a city of more than 100,000 inhabitants which does not grant transfers on an extensive scale.

For statistics see MUNICIPAL OWNERSHIP, page 791.

The rapid increase in public ownership has made an impression on private enterprises. More recent private tramway undertakings have reflected the municipal standard, especially about London, where some splendid private lines have been opened. The fear of a demand for public ownership has compelled the street-railway companies, as it has the gas and electric lighting companies, to do many things which would have been deemed impossible a few years ago.

One of the most insistent sources of discontent under private management was the bad condition of the employees. Their hours were very long, oftentimes eighty hours a week and sometimes as much as fourteen hours per day. The rate of wages was low. This led to constant friction and was one of the principal causes of municipalization. The cities have uniformly corrected such abuses.

Labor Present hours range from fifty-four to sixty per week, with one day off in seven. Wages now range from 5d. to 7d. (10 to 14 cents) an hour for motormen and 4½d. to 7½d. (9 to 15 cents) for conductors, while free uniforms and one week's holiday on pay are nearly universal. In some cities special funds are set aside for sickness and disability and death, while recreation rooms, with games, baths, and cafés, are found in many cities. The highways committee of the London County Council estimates that "the value of the concessions already made to the men in respect of increase in pay or alteration of hours and other matters amounts now to about £37,000 (\$180,061) a year." In Liverpool, according to Sir Charles Petrie, "the men have been provided with summer and winter uniforms, and we are paying them in wages upward of £40,000 (\$194,660) per annum more than they would have received under companies' rates."

GERMAN MUNICIPAL STREET-RAILWAYS 1

The introduction of the electric-railway marks a turning-point in the history of street-railway development in Germany. It inaugurated a movement toward municipal ownership and operation which is sweeping over the entire empire and which includes not only the larger cities, such as Munich, Frankfort, Cologne, and Nurnberg, but small towns such as Bonn, Trier, Colmar, and Graudenz.

Of the four larger cities that have embarked upon municipal operation of street-railways, the financial situation of the Frankfort system is most favorable. At the close of the fiscal year 1903, after paying all operating expenses, there remained a surplus of \$576,574.25. Out of this the fixt charges were paid, amounting to \$295,813.65.

From the remaining \$280,760.60, the city contributed \$15,805 toward the pension fund for employees, \$4,057.50 toward the pension fund for orphans and widows of employees, and \$36,250 toward the repaving and widening of streets, leaving a net profit of \$224,648.10.

In Cologne the fiscal year 1903-4 showed a net profit of \$130,816.06.

¹ Compiled from "Municipal Ownership and Operation of Street Railways in Germany," by L. S. Rowe, Ph.D., in the *Annals of the American Academy of Political and Social Science*, 1906.

In Nurnberg the financial results of the first two years of municipal operation have been satisfactory. The street-railway account is burdened with the interest and liquidation charges on the loan contracted for the canceling of the companies' franchise. This means an annual outlay for thirty years of about \$138,000. In spite of this first charge, the street-railway department turned over to the general city treasurer a net profit of \$13,669.89 in 1903, and \$38,263.91 in 1904.

Fares.—Frankfort has a zone tariff system. The graduation of fares is as follows:

For one mile and one fifth or less, 2½ cents.
Over one mile and one fifth and less than two miles and one tenth, 3½ cents.
Over two miles and one tenth and less than three miles, 5 cents.
For every nine tenths of a mile over three miles, 1½ cents.

Cologne has recently introduced a new zone tariff system arranged as follows:

| | |
|-------------------------|----------|
| Fare for 1½ miles..... | 2½ cents |
| Fare for 3½ miles..... | 3½ cents |
| Fare for 5½ miles..... | 5 cents |
| Fare over 5½ miles..... | 6½ cents |

With every fare exceeding two cents and a half a free transfer is issued.

Nurnberg and Darmstadt are the only cities of any size which still retain the uniform fare in their municipal railway system. The fare is two cents and a half.

In Barmen the uniform two-cent-and-a-half fare with free transfer was also introduced immediately after the municipalization of the street-railways. Monthly commutation cards good for all portions of the system were issued at \$1.25. In Dec., 1903, this system was replaced by a zone tariff under which the lines were divided into five zones of two miles and a tenth each. The rate for each zone was fixed at one cent and a fourth with a maximum fare of two cents and a half.

In Königsberg within the limits of the city the uniform two-cent-and-a-half fare is retained; beyond the city limits three cents and three-fourths is charged.

Labor Conditions Under Municipal Management.—One of the most notable achievements of municipal operations in Germany has been the betterment of the labor conditions. The German cities undertook without delay to readjust the hours of labor so as to bring them within the ten-hour limit and so to arrange the schedules that this ten-hour service should be as continuous as possible.

JOHN MARTIN.

STRIKE-BREAKING: The most recent institution for meeting the exigencies of modern industrial life is an establishment concerned in strike-breaking. This is an agency which provides men to factories, street-car lines, etc., the employees of which have gone on strike. The strike-breakers are not a hoodlum class, neither are they men looking for excitement or occasional work; but a set of picked men, each skilled in a particular line of work. The agency has about 225,000 men on its lists in different trades throughout the United States. The handling of such an army of workmen and their proper placing in times of need requires system.

Candidates, in order to get their names on the list, must pass a rigorous examination as to character and physical and professional fitness. A corps of twenty-three men is detailed to examine

candidates. When a strike is impending or has been declared, this agency is notified by the employers, and it contracts to supply a sufficient number of skilled men to take the place of the strikers, and then selects its men, each of whom must sign an agreement to keep at work on the new job at least thirty days. Traveling expenses in addition to good wages are paid by the agency. The agency maintains a commissary and a quartermaster's departments to feed and house the strike-breakers, and is able to fill the strikers' places within a very short time.

Strike-breakers are, however, frequently exposed to violence on the part of the strikers and their friends. A department of protection has been formed by the agency to provide adequate protection for its men. The head of this department is in touch with sheriffs and police officials over all the country. His men, numbering between 500 and 600, are sworn in as special deputies on each occasion so as to have a legal standing; they are under military discipline and must pass an examination equivalent to that for the police department of New York.

While the department of protection is well organized and reckless or irresponsible men are kept out, it is nevertheless a reflection on the city, state, or county to have need of this private army of detectives or deputies for the protection of private or corporate property. The agency has succeeded well in breaking strikes, and has attained large financial success. But it is open to the same objection as the Pinkertons (*q. v.*) and other private semimilitary organizations within the state having the privileges but not the responsibilities of public officials.

STRIKES AND LOCKOUTS: (For a discussion of principles involved, see **TRADE-UNIONS.**) A strike occurs when the employees of an establishment refuse to work unless the management complies with some demand. A lockout occurs when the management refuses to allow the employees to work unless they will work under some condition dictated by the management. In effect strikes and lockouts are practically the same thing, the disturbances simply originating with one side or the other in the case. A strike, however, is often really a lockout, because it not unfrequently happens that employers, finding a dull market and not wishing to bear the opprobrium of discharging their employees or suspending work, require some grievous condition which causes the employees to strike. The real origin of strikes is, therefore, by no means always easily determined.

Strikes are as old as labor itself. For the slave insurrections and labor strikes of classic times, see **GILDS.** In Germany we hear of a strike in

Breslau among the journeymen girdle makers as early as 1329, and in France among the tanners in 1349.

According to Mr. and Mrs. Webb, there was a strike and perhaps a trade-union among the serving-men of the cordwainers in London in 1387. In France in the next century they seem to have been common. In 1538 in England (the Webbs' "History of Trade-Unionism"):

The Bishop of Ely reports to Cromwell that twenty-one journeymen shoemakers of Wisbech have assembled on a hill without the town and sent three of their number to summon all the master shoemakers to meet them, in order to insist upon an advance in their wages, threatening that

"there shall none come into the town to serve for that wages within a twelfth-month and a day, but we will have an harme or a legge of hym, except they will take an othe, as we have doon."

The first strike in the United States was probably among the New York City bakers in 1741, while in Philadelphia the journeymen shoemakers conducted a series of strikes, 1796-99. According to T. S. Adams and H. L. Sumner ("Labor Problems") the terms "strike," "scab," and "general turnout" were in common use and strikes were "the fashion" by 1835.

The Third Annual Report of the U. S. Bureau of Labor (1887) finds records of 1,491 strikes down to 1881, of which 813 took place in 1880, 199 took place from 1875 to 1879, and 185 from 1870 to 1874; 4 took place in the eighteenth century, the first being a strike among the bakers of New York City in 1741; 75 took place between 1800 and 1850. Of the 1,491 strikes, 1,089 related to wages; 316 succeeded, 154 were compromised, 583 failed, and 478 had their issue unknown.

CAUSES OF STRIKES, 1881-1900

| PRINCIPAL CAUSE OR OBJECT | Establishments involved in disputes | | Establishments involved in disputes | |
|--|-------------------------------------|----------|-------------------------------------|----------|
| | Number | Per cent | Number | Per cent |
| Wages | | | | |
| For increase..... | 54,872 | 46.69 | 750 | 7.55 |
| Against decrease..... | 9,173 | 7.81 | 664 | 6.68 |
| Other..... | 917 | 0.78 | 544 | 5.48 |

¹ The distinction drawn in the report between a strike and a lockout is: "A strike occurs when the employees of an establishment refuse to work unless the management complies with some demand; a lockout occurs when the management refuses to allow the employees to work unless they will work under some condition indicated by the management. . . . In a strike the employees take the initiative while in a lockout the employer first makes some demand, and enforces it by refusing to allow his employees to work unless it is complied with."

STRONG, REV. CHARLES: Founder of Australian Church (Liberal), Melbourne, in 1885; born The Manse, Dailly, Ayrshire, Scotland, Sept. 26, 1844. Formerly Presbyterian clergyman in Glasgow and (1875-84) in Melbourne. Resigned and founded a free church, 1885, and president of Collingwood Working Men's Club, a founder of Collingwood Crèche, and of Convalescent Home for Men. Vice-president of Anti-Sweating League and member of Royal Commissions on Non-employment and on Bible in State Schools. Member of State Commissions on Cause and Cure of Inebriety. President of Criminology Society. Chairman of Peace Society. Editor of *Australian Herald*. Author of various religious works. Address: Avoca Street, South Yarra, Australia.

STRONG, JOSIAH: President of the American Institute of Social Service; born Jan. 19, 1847, at Naperville, Ill. Attended public school at Hudson, Ohio; graduated Western Reserve University, 1869; studied at Lane Theological Seminary, 1869-71. Missionary in Cheyenne, Wyo., chaplain of Western Reserve University, 1873-1876; pastor Sandusky, Ohio, 1876-81; secretary Home Missionary Society of Ohio, 1881-84; pastor Vine Street Church, Cincinnati, Ohio, until 1886, when he published "Our Country," which

has had a remarkable influence with a circulation of over 175,000, and been translated in several European languages. Secretary of Evangelical Alliance for United States, 1886-98. Becoming, however, more deeply interested in social questions than his associates in the alliance, he founded with Dr. Tolman a league, which in 1902 became the American Institute of Social Service (q. v.), which has led to similar institutes in other countries (see SOCIAL INSTITUTES), and in 1907 organized with Dr. Tolman the American Museum of Safety Devices and Industrial Hygiene.

Dr. Strong has thus stated his social views:

The "kingdom of God," which was the great burden of Jesus's message to the world, was his social ideal. It was a vision of civilization perfected, of heaven come to earth. Just so far and fast as God's will is done among men as it is among angels, so far and so fast will the "kingdom come." I believe that Jesus's teaching concerning the kingdom of God affords the true social ideal, lays down the fundamental laws and principles by the application of which alone can the great social problems be solved, supplies the needed enthusiasm, and inspires complete assurance that this social ideal will ultimately be fully realized. That is, the kingdom of God, as Jesus taught it, affords the aim, the method, the power, and the necessary confidence for the transformation of the world.

Author: "Our Country," 1886; "The New Era," 1893 (50,000 copies); "The Twentieth-Century City," 1898; "Expansion" and "Religious Move-

ments for Social Betterment," 1900; "The Times and Young Men," 1901; "The Next Great Awakening," 1902; "Social Progress," 1904-5, and 1906; "The Challenge of the City," 1907. *Address:* 231-241 West Thirty-ninth Street, New York.

SUBSIDIES: Aid granted to individuals or corporations chiefly to encourage manufacture and transportation, principally in the form of relief from taxation, of land grants, or of subvention in money. This last is the usual meaning in which the term is now used, and the only one considered in this article. (See also BOUNTIES; LAND; PUBLIC DOMAIN.)

The most important modern subsidies have been to railways and steamship companies.

England has granted no railway subsidies except in Ireland. France defrayed about half the original cost of her railways, and this system has been largely followed in Austria, Russia, southern Europe, and British India. In the United States railway subsidies, in the form of land grants mainly, have been very extensive. (See RAILWAYS.)

Great Britain.—Ship stores have been free since the time of the Armada; but George II. granted a direct bounty to aid shipping in 1730. Its purpose was to encourage herring fisheries and thus indirectly to train sailors and marines for the navy. Since that time Great Britain has almost continuously aided her shipping corporations, partly for the encouragement of British trade, but chiefly to maintain efficient communication with her colonies. The latter object has been of great value to the United Kingdom since in times of war, e. g., the Crimean and the Sepoy Rebellion. In the Boer War (1899-1900) England was able to transport a vast army within a short time to a distance of 6,000 miles, in addition to the necessary supplies. While vast sums have been spent in subsidies, English statesmen believe that they have been good investments. In 1901 the government paid £874,155 to twenty steamship lines; the Cunard Line alone receives since 1902 £150,000 annually.

Germany pays to three lines about 10,175,000 marks for carrying mails to America, Australia, East Asia, and East Africa, besides granting other benefits in the form of release from import duties and reduction in freight on railroads, etc., in all materials used in ship-building. *France* has been anxious to build up a mercantile marine, and is paying about 45,150,000 francs annually to shipping corporations, besides granting premiums to ship-builders. *Austria*, too, paid about \$1,600,000 and Hungary over \$400,000 in 1901. More recently Hungary has made an agreement with the Cunard line for a fortnightly service from Fiume. *Italy* has paid subsidies for navigation and construction since 1885, and paid for the former nearly \$395,000 and for the latter about \$20,250 in 1897; this sum has since been increased. She paid about 20,000,000 liras in 1906. *Japan* pays heavy bounties on navigation and construction since 1897. Since 1900 she pays over \$2,162,200 to the lines running to Europe, San Francisco, and Seattle. Denmark, Holland, Norway, and Sweden pay only a fair return for the carrying of mail.

Railroads are subsidized in nearly every European country by having the capital for construction advanced by the State. England has subsidized the Canadian Pacific line. The U. S.

have made grants of vast tracts of land to nearly every railroad in the West; the states and municipalities have offered additional inducements. The Central & Union Pacific alone received 30,000,000 acres of land, and a subsidy of \$25,000 per mile in the form of a loan, with the more or less tacit understanding that it would never be repaid. The subsidies to railroads have, however, served a very useful purpose in opening the vast lands of the West, and thus enriching the whole country; while the aid to shipping corporations has been of no value.

The U. S. have granted ship subsidies since 1845. From that time to 1858 they amounted to about \$15,000,000. From 1867-77 another sum of \$4,583,000 was granted to a single company; and another company received \$250,000 per annum. In 1891 a new arrangement was made; mail is now paid for by mileage at a fixed rate. On Feb. 15, 1906, the Senate passed the Ship Subsidy Bill, granting \$50,000,000 in aid of mercantile marine enterprises for twenty years. The grants to railroads have been much larger and have produced better results.

SUFFRAGE, THE, IN VARIOUS COUNTRIES: Every country has certain legal disabilities, e. g., for crime, military or civil service, receiving relief from poor funds, etc.; these are not stated here, but only the general requirements.

Argentine Republic.—Universal male suffrage for all native or naturalized citizens at least twenty-one years old.

Australia.—Laws made by the separate states. New South Wales and New Zealand have universal male and female suffrage for citizens over twenty-one years of age. Tasmania universal male and female suffrage for the House of Assembly, but a property qualification for the Legislative Council applicable to both sexes. Queensland has a property qualification for male suffrage. South Australia and Western Australia have a property qualification for both men and women. Victoria has a property qualification for men of little education; professional men are freed from that.

Austria.—Universal, equal, and direct male for citizens twenty-four years of age (by law of November, 1906.)

Belgium.—For *Chamber of Representatives:* every male citizen twenty-five years of age, one vote. Every citizen over twenty-five years of age owning real estate to the taxable value of 2,000 francs, or has a corresponding income from such property, or has for at least two years derived not less than 100 francs a year from Belgian funds either directly or through the savings-bank, has two votes; every citizen over thirty-five years of age, who has children—whether married or widowed—and pays at least 5 fr. in income tax, has also two votes. Every citizen at least twenty-five years of age, who has received a diploma of higher or a certificate of higher secondary instruction, or has filled an office or is engaged in private professional practise implying at least average higher instruction, has three votes. For the *senators* who are elected the same conditions are required with the additional specification that electors must be at least thirty years of age. No citizen has more than three votes.

Brazil.—Every male citizen over twenty-one years of age, duly enrolled, has one vote, except beggars, illiterates, and members of monastic orders under vows of obedience.

Canada.—The franchise is controlled by the different provinces; but it is practically universal on condition of certain property qualifications.

Cape Colony.—Property and educational qualifications for men.

Chile.—Universal male with educational qualification for citizens twenty-one years old.

Denmark.—Universal male for citizens thirty years old.

Finland.—Universal male and female for citizens twenty-four years old.

France.—Universal male for citizens twenty-one years old.

Germany.—Universal male for citizens twenty-five years old for the *Imperial Diet or Reichstag*. The individual states have separate election laws for their respective *Landtage* or state legislatures, altho most of the states in South Germany have or are following the example of Bavaria (law of April 6, 1906) in giving the franchise to every citizen twenty-five years of age.

Prussia has peculiar election laws. The members of the *Abgeordneten Haus* are elected indirectly, by electors or *Wahlmänner*, who are distributed according to property qualifications in such wise that one third is elected by the few rich people who pay one third of the total taxes; one third by the larger class that pays the second third; and one third by the smallest taxpayers. One *Wahlmann* is elected for every 250 souls. Every male citizen, qualified to vote in his municipality or village, is called *Urwähler*, and entitled to vote for the direct electors or *Wahlmänner*. Age requirement in each case twenty-five years. The election laws of *Saxony* are the same as those of *Prussia*.

Great Britain.—(See UNITED KINGDOM.)

Greece.—Universal manhood suffrage.

Hungary.—Citizens twenty years old and paying at least a low amount of taxes. Is agitating universal male suffrage.

Italy.—Has male suffrage; age requirement twenty-one years of all citizens; also educational or property qualifications.

Japan.—Male suffrage for citizens twenty-five years old; property qualifications, ten yen in land or direct taxes.

Mexico.—All respectable adult male citizens may vote.

Netherlands, The.—All male citizens twenty-five years of age, self-supporting, and paying at least one florin in taxes.

Norway.—Universal male suffrage for citizens twenty-five years old.

Portugal.—Male citizens twenty-one years old, with the necessary educational and property qualifications.

Rumania.—Educational and property qualifications for adult male citizens. Three classes of electors as in *Prussia*. (See GERMANY.)

Russia.—Educational and property requirements.

Servia.—Male citizens, twenty-one years old, and paying 15 francs in taxes or over.

Spain.—Universal male suffrage for citizens twenty-five years old.

Sweden.—Native male citizens, twenty-one years old, with fairly high property requirements.

Switzerland.—Universal male suffrage for citizens twenty-one years old.

United Kingdom.—Every adult male citizen may vote who pays at least £10 rent a year; or has a freehold to the value of 40s. per annum; or lands in life tenure or leasehold for sixty years

to the annual value of £5 or over. Residence within the district is required for six months in England and one year in Scotland.

United States.—Universal male suffrage for citizens twenty-one years old. The states have various additional requirements and rights. Residence required in the state is usually one year, in the county six months, in the district thirty days. Idaho, Colorado, Utah, Wyoming, have female suffrage in state elections. Many other states allow women to vote in school elections. A few states, e. g., Kansas and Nebraska, give the franchise to aliens who have declared their intention to become citizens.

SUICIDES (for number of suicides in the United States, see CRIME, p. 336): Suicides seem on the increase.

United States.—Per 100,000 of population, estimated from statistics of the *Chicago Tribune*:

| | | | |
|-----------|------|-----------|-------|
| 1885..... | 1.73 | 1903..... | 10.76 |
| 1890..... | 4.19 | 1904..... | 11.39 |
| 1895..... | 8.27 | 1905..... | 12.08 |
| 1900..... | 8.85 | 1906..... | 12.05 |

¹ Probably less fully reported.

Frederic Hoffman, statistician of the Prudential Life-Insurance Company, gives the following rate per 100,000 of population in fifty cities of the U. S.:

| | | | |
|-----------|------|-----------|------|
| 1890..... | 12.0 | 1897..... | 17.3 |
| 1891..... | 14.0 | 1898..... | 17.3 |
| 1892..... | 13.0 | 1899..... | 16.0 |
| 1893..... | 15.9 | 1900..... | 15.8 |
| 1894..... | 15.5 | 1901..... | 16.6 |
| 1895..... | 15.6 | 1902..... | 17.0 |
| 1896..... | 15.9 | | |

Great Britain.—Coroners' returns per 100,000 of population:

| | | | |
|-----------|------|-----------|-------|
| 1863..... | 6.71 | 1893..... | 8.62 |
| 1873..... | 6.33 | 1903..... | 10.43 |
| 1883..... | 7.30 | 1904..... | 9.85 |

German Empire.—The Statistical Year Book of the German Empire gives the annual averages per 100,000 of population for the following given periods in cities of over 15,000 (higher than the rate for the country):

| | | | |
|--------------|------|----------------|------|
| 1877-81..... | 31.0 | 1897-1901..... | 24.5 |
| 1882-86..... | 29.0 | 1902..... | 26.2 |
| 1887-91..... | 25.4 | 1903..... | 26.4 |
| 1892-96..... | 26.1 | 1904..... | 25.0 |

In France the growth of population since 1830 has been 100 per cent, but the number of suicides is said to have increased by 245 per cent. In Belgium the suicide rate has, in the same time, quintupled. In *Prussia*, while the population increased 0.98 per cent, suicides increased 1.07; of Italy the population rate was 0.7, the suicide 1.28; of France 0.07, and 2.06; of Sweden 0.81, and 1.5.

According to Hoffman (see above), based on the census of 1900, suicides in the U. S. were:

IN CITIES PER 100,000 POPULATION, 1905
(Estimated from the census)

| | | | |
|---------------------------|-------|--------------------------|-------|
| San Francisco..... | 50.44 | Pittsburg..... | 16.47 |
| Denver..... | 32.27 | New Orleans..... | 16.36 |
| Newark, N. J..... | 28.11 | Kansas City..... | 15.21 |
| St. Louis..... | 24.80 | Baltimore..... | 14.90 |
| Chicago..... | 22.20 | Louisville..... | 14.46 |
| Milwaukee..... | 22.46 | Philadelphia..... | 14.00 |
| Cincinnati..... | 21.97 | Boston..... | 13.86 |
| Indianapolis..... | 21.50 | New York (Brooklyn)..... | 13.28 |
| Jersey City..... | 20.88 | Detroit..... | 9.21 |
| Cleveland..... | 20.74 | Fall River..... | 2.50 |
| New York (Manhattan)..... | 20.56 | | |

According to a table compiled by George M. Gould, M.D. ("Biographic Clinics," vol. v., p. 193), from data mainly supplied him by the U. S. Bureau of Statistics, the suicides per million in various countries are as follows:

| COUNTRY | Date | Total per annum | Per 100,000 |
|---------------|---------------|-----------------|-------------|
| Ireland | 1887-91 | 112 | 2.4 |
| Russia | Approximately | | 2.7 |
| Scotland | 1887-91 | 224 | 5.6 |
| Italy | 1902 | 2,010 | 6.1 |
| Holland | 1904 | 371 | 6.7 |
| Norway | 1903 | 154 | 6.7 |
| United States | 1900 | 5,498 | 7.2 |
| England | 1903 | 3,511 | 10.5 |
| Belgium | 1903 | 818 | 11.7 |
| Bavaria | 1887-91 | | 11.8 |
| Sweden | 1902 | 804 | 15.5 |
| Austria | 1901 | 4,291 | 16.4 |
| Japan | 1902 | 9,194 | 18.9 |
| Prussia | 1904 | 7,290 | 20.0 |
| Germany | 1904 | 12,468 | 21.0 |
| France | 1902 | 8,716 | 22.3 |
| Switzerland | 1903 | 779 | 22.2 |
| Denmark | 1887-91 | | 25.3 |
| Saxony | 1864-86 | | 32.2 |
| Saxony | 1898 | | 46.9 |

For the U. S. the annual report of the Census Bureau for 1905 gives the following statistics:

SUICIDES PER 100,000 OF POPULATION

| YEAR | Registration area | Registration cities | REGISTRATION STATES | | | Registration cities in other states |
|------|-------------------|---------------------|---------------------|--------|-----------------|-------------------------------------|
| | | | Total | Cities | Rural districts | |
| 1901 | 12.2 | 13.7 | 10.4 | 11.7 | 8.7 | 15.7 |
| 1902 | 12.7 | 14.4 | 10.3 | 11.7 | 8.5 | 17.2 |
| 1903 | 13.9 | 15.6 | 11.3 | 12.8 | 9.4 | 18.6 |
| 1904 | 14.8 | 16.7 | 12.2 | 13.9 | 10.1 | 19.5 |
| 1905 | 16.1 | 17.9 | 13.5 | 15.0 | 11.6 | 20.7 |

REGISTRATION AREA PER 100,000 OF POPULATION

| | Annual average: 1900 to 1904 | 1901 | 1905 |
|--------------------------|------------------------------|------|------|
| Suicide | 13.1 | 12.2 | 16.1 |
| Poison | 4.4 | 4.0 | 5.4 |
| Asphyxia | 0.9 | 0.8 | 1.5 |
| Hanging or strangulation | 2.0 | 1.9 | 2.4 |
| Drowning | 0.7 | 0.7 | 0.8 |
| Firearms | 3.1 | 2.9 | 4.3 |
| Cutting instruments | 0.7 | 0.7 | 0.9 |
| Jumping from high places | 0.2 | 0.1 | 0.2 |
| Crushing | 0.1 | ... | 0.1 |
| Other suicides | 1.0 | 1.1 | 0.6 |

The leading cities in proportion of suicides to population are: St. Louis, Mo.; Hoboken, N. J.; Chicago, Ill.; Oakland, Cal.; New York City (Manhattan and Bronx); Milwaukee, Wis.; Cincinnati, Ohio. The lowest cities were New Bedford, Mass.; Camden, N. J., and Newton and Fall River, Mass. (lowest of all). According to the census of 1900 in the registration area, the suicide rate of native Americans is returned at 6.8 per 100,000 of population, against 6.1 for those of Irish origin, 19.3 for those of German origin, and 22.0 for those of French origin. According to Professor Bailey, in the *Yale Review*, May, 1903, the following is

the classification of the suicides in respect to motive:

| MOTIVE | Totals | Males | Females |
|---------------------------|--------|-------|---------|
| Despondency | 2,207 | 1,596 | 431 |
| Business loss | 1,398 | 1,300 | 98 |
| Insanity | 1,361 | 1,013 | 348 |
| Ill health | 1,309 | 969 | 340 |
| Disappointment in love | 900 | 627 | 273 |
| Domestic trouble | 773 | 544 | 229 |
| Fear of disgrace | 539 | 429 | 110 |
| Grief | 427 | 267 | 160 |
| Alcoholism | 413 | 390 | 23 |
| Chagrin | 294 | 225 | 69 |
| Miscellaneous and unknown | 559 | 421 | 138 |
| Totals | 10,000 | 7,781 | 2,219 |

The *Chicago Tribune's* report thus classifies the reports of the causes of suicide of the year:

| MOTIVE | 1905 | 1906 |
|------------------------|-------|--------|
| Business losses | 32 | 58 |
| Liquor | 375 | 119 |
| Ill health | 411 | 388 |
| Unknown | 721 | 413 |
| Disappointment in love | 958 | 1,113 |
| Domestic infelicity | 1,525 | 2,125 |
| Insane | 1,826 | 1,326 |
| Despondency | 4,134 | 4,561 |
| Totals | 9,982 | 10,125 |

According to Dr. Gould (see above), if the larger portion of the "Despondency" cases is added to the "Ill health" class the results are not very dissimilar to his own independently made classification. He quotes De Greef as saying that the principal social conditions causing suicide, in the order of their importance, are: (1) poverty; (2) family difficulties; (3) physical suffering, of about equal power; (4) alcoholism; (5) fear of legal persecution; (6) love, jealousy, and debauchery.

Dr. Gould finds the following facts: (1) Suicide is on the increase. (2) Civilization increases the suicide rate more rapidly than the growth of population. (3) The urban suicide rate is higher than that of the country. (4) The influence of occupation upon the rate is most incongruous. (5) The rate in contiguous countries, departments, or "races" presents inexplicable variations. (6) With one exception the rate in males is several times higher than in females. (7) The rate is greater among the single than among the married, and is still higher among the divorced and widowed. (8) The age or time of life at which suicide is committed presents inexplicable peculiarities. (9) The rate rises in proportion to school pressure, education, etc.

SUMNER, WILLIAM GRAHAM: Economist; born in Paterson, N. J., 1840; graduated at Yale College in 1863, and then studied at Oxford, England, and at Göttingen in Germany; 1866-69 was a tutor at Yale College. In 1867 he took orders in the Protestant Episcopal Church, and was assistant at Calvary Church in New York. In 1872, however, he became professor of political and social science at Yale College, which position he has since held, one of the leading economists in America of the orthodox school, especially on the subjects free trade and gold currency. Author: "History of American Currency," "Lectures on the History of Protection in the United States";

"What Social Classes Owe to Each Other"; "Protectionism"; "Life of Andrew Jackson"; "Life of Alexander Hamilton"; "Life of Robert Morris"; "The Financier and Finances of the Revolution"; "A History of Banking in the United States"; "Folkways." Address: 240 Edwards Street, New Haven, Conn.

SUMMERBELL, THOMAS: Member British Parliament, of Independent Labor Party for Sunderland; born in 1861 at Seaham Harbor, Sunderland; educated at the national school of his native town; worked as a grocer, later as printer, in many towns of northern England, until he started in business for himself in Sunderland; joined the Typographical Society, and has been secretary of the Trades Council for seventeen years. He is member of many committees of his town, chairman of that on Tramways, and honorary secretary of the local branch of the League of the Blind. He is a member of the Housing Reform Council, Land Nationalization, Foresters, Labor Information Bureau, Independent Labor Party, etc. He was elected to Parliament in 1906. Address: 14 Vincent Street, Sunderland, England.

SUNDAY REST, THE: With the religious and theological arguments raised for the limitation of Sunday labor we are not in this Encyclopedia concerned, save as these affect the moral, physical, and industrial welfare of society. In the ever-increasing perplexity and stress of modern life, it is patent to all that men more and more need a rest, at least one day in seven, from their daily toil. It is to-day substantiated, beyond all question, that man in the long run can produce more and better work by resting one day in seven than by continuous work. And men and women who have such rest live longer and more happily, and stand higher on the scale of intellectual, moral, social, and spiritual being.

Dr. Chalmers, of Scotland, said: "I never knew the man who worked seven days in the week without becoming soon a wreck in health or in fortune, or in both."

Edmund Burke said: "A nation that neglects the Sabbath soon sinks into barbarism or ruin. Civilized man cannot bear the pressure of seven days' work and worry in a week."

As a matter of fact, leaving out England and America, where there has been less need of legislation on the subject because of the prevalence of the Sunday rest, the main and most efforts for legislation forbidding or limiting Sunday labor have come from the working men themselves, through their trade-unions and the Socialist and Labor parties. In most countries they have done far more for it than has the Church. On the

Continent the prevalence of Sunday labor has been a subject of general protest and bitter complaint. Even in the United States of late years Sunday labor has in many ways much increased. It has been estimated that two millions of persons in the U. S., or more, are compelled to do some form of Sunday labor.

On railroads, on street-railways, in livery-stables, in making repairs (often only done on Sunday, because employers are unwilling to forfeit week-day dividends), in bakeries, in hotels, in private houses, in barber shops, in drug stores, in printing-offices, in theaters and places of amusement, a constantly increasing amount of work is

done on Sunday. Working men bitterly complain of this, yet too often find even the Christian Church turning a deaf ear to their cry, and even clergymen unwilling to cooperate in limiting the hours of labor.

There has, however, been considerable agitation of the question in all countries, resulting in the legislation summarized below, and in Europe especially in a very general abandonment of Sunday labor in manufactures and to a less extent has led to the closing of stores on a portion if not the whole of Sunday. Sunday Rest Leagues (*associations or ligues pour le repos du dimanche*) have been organized in France, Belgium, and Italy, and elsewhere, and have been very active. There exists also a *Fédération Internationale pour l'observation du dimanche*, with headquarters in Geneva, Switzerland. In England there has seemed less need. In the U. S. labor organizations have largely agitated the question, and various societies like the New England Sabbath Protective League, the American Sabbath Union of New York, the International Reform Bureau of Washington, have circulated considerable literature and conducted other efforts on the question. In France and Belgium the main effort has been to close the stores on Sunday afternoons and prevent all unnecessary industrial labor. In England a joint committee of the Houses of Lords and Commons, under the chairmanship of Lord Avery, has recommended general legislation, leaving much discretion, however, to local authorities. There is a strong movement, too, to open the museums, galleries, and libraries. (See NATIONAL SUNDAY LEAGUE.) In the U. S. the effort on the part of the working men has been against all work, while the religious societies have worked for this and are against the running of trains on Sunday and the opening of places of amusement. In all countries, in cases where Sunday labor is necessary, it is contended that the laborer should be given a day of rest on some other day of the week, and that the work which must be done on Sunday be given on different Sundays to different workmen, so as to give each the Sunday rest as frequently as possible. The Sunday legislation may thus be summarized:

The United States.—All states and territories except Arizona, California, Idaho, Nevada, and the Philippine Islands have laws prohibiting the employment of labor on Sundays. In California, however, it is a misdemeanor for any employer to cause his employees to work more than six days in seven except in cases of emergency.

The Sunday labor laws usually make it a misdemeanor for persons either to labor themselves or to compel or permit their apprentices, servants, etc., to labor on the first day of the week. Exceptions are made in the case of household duties or works of necessity or charity. These exceptions are sometimes expressed in general

United States terms and sometimes specified in detail. The excepted labor is usually that required in the sale of drugs, medicines, surgical appliances, milk, ice, soda-water, newspapers, the letting of horses and carriages, undertakers' work, and railway transportation. In Colorado and Montana barbering only is prohibited on Sunday, while in Alaska barbering is included among the excepted occupations.

A number of states make special provisions for the running of railway cars on Sunday, such as specifying certain hours during which they may run, permitting the transportation of perishable goods, fruit, milk, etc., or leaving the regulation of the running of railway cars on Sunday to the discretion of the railroad commissioners.

Nearly all the Sunday labor laws make exceptions in the case of members of religious societies by whom any other than the first day of the week is observed as a Sabbath, provided they refrain from labor on that day.

Laws regulating the hours of labor of street-railway employees are in force in California, Louisiana, Maryland, Massachusetts, New Jersey, New York, Pennsylvania, Rhode Island, South Carolina, and Washington. In some cases the

Sunday
Labor

Limitation of the hours of labor applies only to conductors, gripmen, motormen, and drivers, while in others it applies to all street-railway employees. In Louisiana, Massachusetts, New York, Rhode Island, and Washington the hours are limited to ten per day, while in the other states the limitation is placed at twelve hours per day. The laws usually provide that extra time for extra compensation may be worked in times of extraordinary emergencies, Massachusetts and Rhode Island permitting exceptions to be made also on legal holidays. The law of Rhode Island, by an amendment to the original act, permits contracts to be made for longer hours. In South Carolina contracts for longer hours of labor may be made in the city of Columbia.

Germany.—Germany has the fullest code of Sunday laws. The regulation anew of Sunday labor was one of the most important features of the labor law of June 1, 1891. It set forth in detail the conditions under which work might be performed on Sunday, and made the infraction of any of its provisions punishable by a fine, which in some cases amounted to as much as 600 marks (\$142.80). The essential provisions of this law are reproduced in the following paragraphs:

The general principle of the act is that all labor on Sunday and holidays is prohibited in those cases specifically mentioned by the law. This prohibition applies to almost all categories of industrial and commercial work, except when a workman labors alone or is aided only by the members of his family. It does not, however, apply to agriculture, forestry, fishing, and the liberal arts and professions, nor to concerts, theaters, cafés, restaurants, hotels, and the like, nor to transportation, except when it is a part of the work of an industrial or commercial establishment.

The law further provides that the prohibition of Sunday and holiday work may be extended by an imperial decree approved by the Bundesrath to industries other than those specified in the law. Such decrees must be placed before the Reichstag at its next session.

The determination of the days to be considered as legal holidays is made by the State government in taking account of the religious customs of the people. The cessation from labor must be for twenty-four continuous hours on each Sunday and holiday, thirty-six hours when a Sunday and holiday or two holidays succeed each other, and forty-eight hours at Christmas, Easter, and Pentecost. When a Sunday and holiday or two holidays succeed each other the rest period must always last until 6 P.M. of the second day, and as it must begin at midnight in establishments working

Germany only in daytime or in irregular shifts, in such cases it lasts forty-two instead of thirty-six hours. In establishments working continuously night and day by shifts, it may for a holiday or Sunday begin not earlier than 6 P.M. of the day preceding nor later than 6 A.M. of the day itself, and last for twenty-four hours, in which case the whole establishment shuts down for that length of time.

In commercial establishments (*Handelsgewerbe*) no labor must be performed on Christmas, Easter, or Pentecost. On other holidays and on Sunday employees may be allowed to work not more than five hours. Power, however, is given to the local authorities to limit still further or even to suppress this privilege.

To this general prohibition of commercial work on Sunday there are a number of exceptions. During those periods of the year when trade is unusually active, as the four weeks prior to Christmas and certain times when the people from the rural districts come to the cities to make their purchases, the police authorities can permit stores to remain open for as many as ten hours on Sunday and holidays. The exception made in the case of persons working alone or only aided by members of their families in industrial work does not apply to commercial establishments. The prosecution of business by shops conducted in this way or by peddlers on Sunday is equally prohibited with that of other commercial establishments.

The impracticability of attempting to restrict all Sunday work, no matter what its nature or circumstances under which it must be performed within the limits described above, has necessarily been recognized by the German Parliament. The law, therefore, provides in detail the cases in which these restrictions shall not apply. These exceptions are in part enumerated in the law itself and in part are left to the Bundesrath or other governmental authorities to determine.

The following classes of work are enumerated by the law as exempt from the prohibition of Sunday and holiday work: (1) Work which public convenience requires shall be promptly executed; (2) the making of inventories required by law; (3) the guarding of plants, and the cleaning, repairing, and other work necessary for the maintenance of the equipment or to insure that the work shall not be interrupted, and which cannot be performed on other days; (4) work indispensable in order to preserve materials employed or goods manufactured, as far as this work cannot be done on week-days.

In order to prevent an improper advantage being taken of these exceptions, it is provided that, whenever work of this kind is performed, the employer must keep a record showing for each Sunday or holiday the number of persons employed, the duration of their labor, and the nature of the work performed. This record must be always open to the inspection of the factory inspectors or local authorities.

In those cases where working men have been employed, as provided in the third and fourth cases, for more than three hours, or have been prevented from attending divine worship, the employer must give to them twelve hours' rest every other Sunday between the hours of 6 A.M. and 6 P.M., or thirty-six hours' uninterrupted rest, including Sunday, every third week. The local authorities, however, can abrogate this provision where the working men are not prevented from attending divine service and enjoy a twenty-four-hours' uninterrupted rest during the week.

By far the most important exceptions, however, are those which the law permits the Bundesrath or the superior or local authorities to accord. The Bundesrath can frame regulations permitting Sunday work in those industries which must be prosecuted without interruption, which can remain in operation only during certain seasons of the year, or which manufacture goods that are only in demand during certain months. Practically the only limitation to the power of the Bundesrath in this respect is that the regulations must be general and apply to all establishments in the same industry. All such orders must be published in the official journal and must be placed before the Reichstag at its next session.

The power of the superior administrative authorities to grant authorizations for Sunday work relates to those industries the operation of which is necessary to satisfy the daily needs of the public, or where the power used is irregular, as water-flow and wind.

The local authorities can grant similar authorizations to particular establishments where such work is necessary to prevent great loss on account of an accident or other unforeseen circumstance. In these cases the authorization must be in writing, and a copy must be posted in the place of work where it can be easily seen by the employees. The authorities must also prepare a statement showing all the cases where this permission has been granted, the number of persons whose employment was permitted, the length of time worked, the reasons for granting the permission, etc.

Finally, it is important to note that not only were the existing laws of the individual states regarding Sunday work not repealed, except in so far as they were in opposition to the imperial law, but full freedom was left to the states to further restrict through legislation Sunday labor within their boundaries.

France.—In 1906, mainly as the result of Socialist agitation, France enacted, with but a single dissenting vote, a law forbidding Sunday labor, with certain definite exceptions.

Government ministers fifteen times a year can allow in State or private establishments work to be done on Sunday, in the interests of the national defense. In hotels, bakeries, restaurants, hospitals, drug stores, newspaper and intelligence offices, etc., employees may labor on Sunday, provided they be given some other day in the week for rest.

Belgium.—In 1905 Belgium enacted a somewhat advanced Sunday Rest Law, tho the Socialists voted against it as delaying the enactment of a more radical law.

It does not apply to transportation by water, fisheries, or public entertainment. In all other industries, except as stated below, no one can employ on Sunday persons except members of his own family and domestic servants. Exceptions are made in cases of necessity, such as preserving perishable material, making repairs, etc. Persons can be employed thirteen days out of fourteen, or six and a half out of seven, in industries connected with food intended for immediate consumption, in hotels and restaurants, tobacco and floral shops, drug stores, public baths, places of amusement, newspaper and intelligence offices, book stores, ticket offices of any sort, works furnishing light, water, or power, employment bureaus, on all modes of land transport, in all work which must of necessity be run continuously. In retail stores persons can be employed Sundays from eight till noon. The law can also be extended or modified within certain limits by royal authority.

Other Countries.—Legislation on this subject is now so generally agitated that change of laws may be looked for at any time, but at present the general situation is as follows:

In Austria Sunday labor in industrial establishments is forbidden, tho with very numerous exceptions, and tho commercial establishments may open on Sunday for six hours. In Denmark Sunday labor in factories is forbidden (with exceptions); stores may be open from 9 A.M. to 4 P.M. Holland has only legislation for children. Russia forbids Sunday labor in industry (with exceptions). In Spain, by an act of 1904, Sunday labor is forbidden in factories, with exceptions, in which case the worker must have some other

day in the week for rest. Canada has made the Sunday rest obligatory by parliamentary action. In Great Britain prosecutions for Sunday trading under ancient acts (of Charles II. and others) have risen in England and Wales from 2,925 in 1893 to 5,510 in 1903 and 5,411 in 1904.

SUNSHINE SOCIETY INTERNATIONAL, THE:

An organization formed in New York City for the purpose of caring for the welfare of blind babies. It was incorporated in 1900, and endeavors to receive every blind child into its home, located at Eighty-fourth Street and Thirteenth Avenue, Dyker Heights, Brooklyn, N. Y. *Secretary:* Mrs. Mary D. Beattie, 96 Fifth Avenue, New York, N. Y.

SUTHERLAND, LADY MILLICENT FANNY

ST. CLAIR-ERSKINE, DUCHESS OF: Born 1869, daughter of the fourth Earl of Rosslyn. Has for some years been deeply interested in social questions and in the economic and industrial conditions of the people. It was through the duchess's influence and instrumentality that Parliament appointed a commission to investigate the terrible lead-poisoning conditions among the pottery workers in Staffordshire; she is president of the Potteries Cripples' Guild; of the Scottish Home Industries Association; president for some time also of the Nicholson Institute at Leek. *Author:* "How I Spent My Twentieth Year"; "One Hour and the Next"; "The Winds of the World"; "Seven Love Stories"; and a play, "The Conqueror." *Address:* Stafford House, St. James's, S. W., London.

SUTTER, JULIE: *Author;* born in India of German parentage. Educated in Germany and French Switzerland, she has lived most of her life in England. Her earlier literary efforts were translations, among these "For the Right," by Francos, and the famous "Letters from Hell." She also translated into German the works of Professor Drummond. Miss Sutter had already written in German a "Life of General Gordon"; but it was while translating Drummond's "Tropical Africa" that she was impressed with the horrors of the slave raids and set herself to rouse Germany with the question: "What are we Germans Doing Against the Slave-Trade?" This pamphlet was instrumental in the suppression of the slavers in East Africa and in forming an African Missionary Society with headquarters at Berlin. While in Germany she met Pastor von Bodelschwingh, and this led to her book "A Colony of Mercy," giving an account of Bodelschwingh's wonderful work in Westphalia; and this in turn resulted in the formation of the British Christian Social Service Union and the establishment of the colony at Lingfield, Surrey, a colony for both epileptics and the workless derelicts of society. Then came the pamphlet "The Homelessness of England" and the book "Britain's Next Campaign"—"a dynamo of a book," according to the *Review of Reviews*. Miss Sutter's views on political economy and social reform are summed up in what is at once the key-note and battle-cry of her book, "Homes for the disinherited ones, an own home, an own bit of land, for a recruiting of the national life-blood, for a saving of the people." Her latest book is "Britain's Hope," May, 1907. *Address:* Lingfield, Surrey, England.

SUTTNER, BERTHA, BARONESS VON:

Founder and president of the Austrian Society of Peace, vice-president of the Internationale Fried-

ensbureau (the International Peace Bureau) at Bern; born June 6, 1843; is the daughter of the Austrian Field Marshal and Count von Kinsky; married Baron von Suttner in 1876. She has traveled extensively, and lived in the Caucasus for nine years. In 1889 she wrote "Die Waffen Nieder" ("Lay Down Your Arms"), which met with instant success, and has been translated into every European language. She has been in the fore in the battle for peace since 1891; has lectured in Europe and America, attended all peace congresses, and written numerous articles on that topic. In 1905 she received the Nobel peace prize as reward for her labor in behalf of peace, particularly for the book "Lay Down Your Arms," and its continuation, "Martha's Children," 1902. *Author:* "Maschinenzeitalter," 1887; "Brieft an einen Toten," 6th ed. in 1904; "Baby's Seventh Love Affair," 1905; "A Bad Man," etc. *Address:* Wien I., Zedlitzgasse 7.

SWAMP-LANDS: The swamp-lands of the United States originally constituted a large proportion of the public domain. The swamp-land law, in brief, provided for the donation to the several states, by the general government, of the swamp-lands included within their borders, with the idea that the states should reclaim them where possible, and secure their settlement. Under this statute many million acres—and much of it in no sense swamp-land—have become the property of the states, and but very little has been done by any of the states to carry out the intent of the law; indeed, some of the states have made no effort whatever to reclaim their swamp-lands. At the present time there are estimated to be in the neighborhood of 100,000,000 acres of swamp-lands, the bulk of which could be drained and reclaimed. The success of the National Irrigation Law has suggested a similar enactment by Congress with reference to swamp-land, a bill having been introduced in the last Congress with provisions similar to those of the irrigation law.

There has been a more or less definite survey of most of our swamp areas which are situated mainly in the eastern half of the U. S., and it is believed that these lands could be drained and made habitable at a cost not to exceed one half of the average price of irrigation reclamation. The lands are in the main extremely fertile, and would provide homes for a multitude of small farmers. Such a law should not be difficult of passage since every eastern state has its swamp area and would benefit thereby.

GUY E. MITCHELL.

SWEAT-SHOPS: The terms "sweat-shops," "sweating system," "sweated industries," while often used more or less loosely of any industrial conditions involving overdriven wage-earners at low wages, is used specifically and more correctly for conditions (mainly in the clothing trades) involving four characteristic evils—long hours, stress of work, low wages, and crowded and unsanitary workshops. There has been, however, a change in the system. Formerly a vital part of the system was the subcontractor or middleman, who would take a job of work from the manufacturer or contractor, and get it done by hiring workers at the lowest possible terms. Competition, however, of late years, in its efforts to lower cost has eliminated the middle man, or the former "sweater," properly speaking.

and made the contractor himself the sweater, hiring the workers himself at the lowest terms. This probably has meant in some respects somewhat improved conditions, as it has to some extent abolished the small sweat-shop in which the former middleman usually employed his workers, and has substituted for it generally larger rooms and somewhat more responsible management; but on the other hand it probably means more overcrowding of many workers in one room, and a more rigid development of an iron system with machine labor driven at the highest speed and wages systematically reduced to the lowest point. So true is this that average rates of wages in the clothing trade have fallen both for men and women from 1890 to 1900, tho earnings for women have slightly risen, owing to speed and greater quantity of work. (See below.) Coupled with this has also gone in most cities, through legislative action, the driving out of sweat-shops from the tenements, and, in some lines of production at least, the prohibition of labor in living-rooms. Agitation, too, and endeavors at organization on the part of workers, has also tended probably to somewhat ameliorate conditions. Yet the steady growth of industry, the growing congestion in cities like New York, through the pouring into them of a swelling tide of immigration (*q. v.*), has made the system a larger and more complex, and therefore, in that sense, a more difficult and serious problem, even tho some of its more apparent evils be diminished.

The steady persistency of the evil under changing forms is one of its most discouraging features. As long ago as 1849 a series of letters in the *London Morning Chronicle* showed the horrors of the sweating system in London, and called out Charles Kingsley's burning tract, "Cheap Clothes and Nasty." This tract tells of men working in sweating-dens, the longest hours for seven days in the week, and paying the sweater for the most meager board such rates that at the end of the week they would be in debt to the sweater and thus be in his power and be compelled to stay on.

Since then there has been in England a more or less steady protest against such evils, and in the United States since about 1890 legislation has been enacted and devoted efforts made to lessen the evil. Yet on both sides of the ocean, among the lower immigrant populations of London, New York, and other cities, the evil is still most serious. In New York City the tailor trade, the main sweated industry, was first in the hands of the English, then the Irish, and later the Germans. Conditions, however, do not seem to have been very bad till about 1880 with the growth of the city and the overcrowding of the East Side. German, Austrian, and Hungarian Jews entered the trade as early as 1873, and soon after the Russian and Polish Jews, who gradually captured the industry, till by 1890 it was almost wholly in Jewish hands, while a fierce and unrestricted competition had lowered wages, lengthened hours, and increased speed of work to the most inhuman degrees—the same conditions to a less extent developing in Boston, Baltimore, Rochester, Philadelphia, and Chicago. About 1890, too, the Italian immigration entered the trade and increased the competition still more:

Increase, too, of a poorly paid population increased the demand for cheap and for ready-made clothing, on which the sweating system thrives.

It is estimated that in 1870 less than 25 per cent of the clothing manufactured in the U. S. was ready-made, but that by 1890 60 per cent was ready-made. Miss Helen L. Sumner, to whose interesting chapter on "The Sweating System," in "Labor Problems," written by herself and Prof. P. S. Adams, we are indebted for many of our facts, traces four distinct stages in the clothing industry. First, production by the journeyman tailor, a fairly skilled mechanic who made up an entire garment. Second, production in home shops, where men or women take portions of garments home to sew on, they having been cut out at some shop. This method was largely produced by the development of ready-made clothing. Third, production by the "task" system, beginning about 1877, of which Miss Sumner says: "The task system has two characteristics. First, there is a 'team' or 'set' of men who work together, each one performing a special part of the labor. Second, a certain task is set, which is called a day's labor, regardless of whether it takes one day or two to perform it. By this means the fiction is maintained that standard wages are paid." Fourth, production in a factory, the present system, and which Miss Sumner thinks may solve the evil. About 1890 there was a general agitation on the system, and in 1892 Congress appointed a committee to report upon the matter. This committee reported that probably the manufacture of clothing was in total value the most important product of the country; that it was largely centered in cities; that over 60 per cent of the clothing sold was ready-made, and that about one half of this was made under the sweating system. Clothing made under this system they declared to be made in premises usually filthy, in the slums and crowded portions of the cities, from places liable to breed germs of disease which could be carried in the clothing, and producing evil in every way. The worst form of the system, the report says, is when the clothing is not made even in sweating-dens but is carried home to be made in the tenements under conditions sometimes defying description.

The main recommendation of the commission was legislation driving the industry out of the tenements. The report of the commission says:

We quote and adopt the reasoning of Dr. Daniels. The one method that can be employed by which we shall be certain that no article is manufactured in tenement-house living-rooms, and that no little children are employed in the manufacture of any goods, is the passage of a law prohibiting such manufacture in tenement-house apartments which are used for living and sleeping purposes. . . . Undoubtedly under such a law a few would suffer. The people who would suffer would probably be only a few women who, from old age or chronic illness, are unable to go to the shops to work. The widows would be forced to find work in the factories, and the orphans sent to school, kindergarten, or nursery. The result would be that women would work in better sanitary surroundings, that no children under fourteen years would be employed in manufacturing goods; the sick would receive proper care, if not at home, then transferred to a hospital, there to get well or die out of sight of the everlasting work.

Concerning legislation, see below.

No little has been done also to organize the trade and with good results. Some portions of the trade have been permanently organized, and even in those where the competition for cheap work has eventually broken up organizations much education and agitation has been produced. (See TAILORING TRADE.)

The main crusade against the evil, outside of the efforts of the workers themselves, has been the effectively conducted National Consumers'

League (see CONSUMERS' LEAGUE) with its "white lists" and its still more effective educational propaganda among the charitably inclined of the upper and middle classes.

Nevertheless, how much evil remains can be seen in the following statement of conditions as revealed largely in the report of the Industrial Commission. Miss Sumner gives the following table as derived from the Twelfth Census:

PRINCIPAL SWEATED INDUSTRIES IN THE UNITED STATES

| INDUSTRIES | Average number of employees | Proportion of women | Proportion of children | Ratio of capital to value of product | Proportion of total wage-earners in 165 principal cities |
|--|-----------------------------|---------------------|------------------------|--------------------------------------|--|
| Men's clothing... | 191,043 | 47.04 | 2.05 | 41.67 | 90.0 |
| Women's clothing, factory product..... | 83,739 | 67.91 | .91 | 30.39 | 91.7 |
| Men's furnishing goods..... | 30,216 | 83.67 | 2.06 | 45.93 | 83.7 |
| Shirts..... | 38,492 | 80.73 | 2.11 | 41.43 | 67.1 |
| Cigars and cigarettes..... | 103,462 | 36.50 | 3.41 | 42.25 | 67.1 |
| All industries in U. S..... | 5,308,406 | 19.39 | 3.17 | 75.49 | 162.5 |

¹ Of forty-nine selected industries.

It is estimated that 39.7 per cent (in value) of men's clothing is manufactured in New York and of women's clothing (factory product) 64.4 per cent; Chicago comes next with 12.7 per cent of men's clothing and 5.8 per cent of women's. Philadelphia, Cincinnati, Rochester, St. Louis, Boston, Baltimore follow in about that order. Of the New York product, it was testified before the Industrial Commission that four fifths is made in sweat-shops.

In Chicago it is said that practically the whole product is made in sweat-shops.

Concerning sweat-shop wages, Mr. Henry White, the former secretary of the United Garment Workers, presented the following table:

| | \$10 suit | \$15 suit | \$20 suit |
|---------------------------|-----------|-----------|-----------|
| Cutting and trimming..... | \$0.15 | \$0.21 | \$0.25 |
| Making coat..... | .75 | 1.00 | 1.50 |
| Making pants..... | .30 | .40 | .55 |
| Making vest..... | .25 | .35 | .50 |
| Total..... | \$1.45 | \$1.96 | \$2.80 |

According to the special census report on employees and wages, the average rate of pay per week in 1900, for cutters (men) was \$17 (1890, \$18); bushelers (men), \$10; sewing-machine operatives (men), \$7 (1890, \$8); general hands and helpers (men), \$5 (1890, \$7); all occupations (men), \$10 (1890, \$11.50); seamers (women), \$5.50; basters (women), \$5; finishers (women), \$4.50 (1890, \$4); sewing-machine operatives (women), \$4; all occupations (women), \$4 (1890, \$4.50). The facts that stand out here that the average rate for men had fallen from \$11.50 per week to \$10 and for women from \$4.50 to only \$4 per week, show how serious is the problem. This is perhaps only increased by the fact that while the rate for women had fallen, the actual

average earnings had risen from \$5 to \$5.50 per week, indicating either increased speed or increased quantity of women's work, and probably for a pittance of \$5.50 per week. What the sweating system really means in hundreds of thousands of cases can be seen in the following quotations compiled by Miss Sumner from reports:

In New York City, for instance, a woman was found "who earned \$70 by twenty weeks' work, which was the entire income for the support of herself, mother, aged fifty-seven years, and sister, aged thirty-two years."¹

The family consisted of a man, wife, and five children, who worked, cooked, ate, and slept in two small rooms. The people looked as tho they had not washed themselves for a year. The boys' coats that they were making were piled upon a dirty bed. The dirt could absolutely have been shoveled out of the rooms. Potato parings, garbage, and filth of all kinds were strewn about the floor, and the odor that prevailed was so foul that one of the agents was made sick.²

The testimony of physicians that have examined them is that, given a sweat-shop that is uninspected, where the members work in the boom season up to the limits of endurance, using foot-power for the machine, it is rare to find, after four or five years, any healthful person there.³

There is no other material that so invites use and deposit during manufacture as to involve to so great an extent as does cloth contact with the persons of the unclean and sick of the family, not merely during the day, but even as a rest for exhausted sleepers. There is probably no material which, once having harbored disease germs or filth, is so favorable to their preservation or propagation as is cloth, especially when made of wool; and, lastly, it would be hard to imagine any material, or use to which it could be put, that would be so repulsive to civilized instincts and so dangerous to life and health as clothing, steeped in contagion, to be worn on the person.⁴

A journeyman tailor of Chicago testified before the Industrial Commission that he knew many men who worked, during the busy season, six days and three nights in the same week, and that he had repeatedly seen men work thirty-six hours without any interruption or sleep or hardly any time to take their meals.

One important point is especially made by Miss Sumner. She says:

It is, moreover, an erroneous idea to suppose that sweat-shop clothing is necessarily poor in quality. On the contrary, overalls and working men's garments are usually manufactured in large factories under good conditions, while some of the worst conditions are found in the custom trade and in the manufacture of beautiful and expensive garments. It was again and again stated before the Industrial Commission that no man in buying a custom-made suit of the best and most fashionable tailor could have any assurance that it was not made in a sweat-shop. The same thing may be said of all classes of women's ready-made clothing.

Dr. Annie S. Daniel says:

It is absolutely impossible to know the number of hours per week which one person might devote to the work, in the busy season—a woman will frequently not have more than five hours' rest in the twenty-four. The hours are regulated solely by the amount of work on hand or by the physical strength of the worker—Sundays and holidays, in sickness and health, work they must. The amount received varies with the kind of work, from a cent and a half an hour to ten cents—very rarely more. (The little children, according to their ages, earn from 50 cents to \$2 per week.) During December the average monthly income of 49 new families was \$13.24; the average rent was \$8.57, leaving the sum of \$4.67 to buy food, fuel, and clothing for the average family of five.

Mr. George A. Weber has prefaced for us the following summary of the legislation of the U. S. as to sweat-shops:

Twelve states, namely, Connecticut, Illinois, Indiana, Maryland, Massachusetts, Michigan, Missouri, New Jersey, New York, Ohio, Pennsylvania, and Wisconsin, have enacted laws regulating sweat-shops.

These laws usually prohibit the manufacture, repair, alteration, or finishing of apparel for wear or adornment, and

² Twenty-first Annual Report of the (Pennsylvania) Bureau of Industrial Statistics, B. pp. 4-5.

³ Industrial Commission, xiv, p. 130.

⁴ Committee Report, H. R., 52-2, v. 1, No. 1,309, p. 22.

the manufacture of purses, cigars, cigarettes, or umbrellas in rooms or apartments in tenement- or dwelling-houses except under certain prescribed conditions. In Massachusetts the law relates only to wearing apparel. The factory inspectors are required to visit and inspect the sanitary condition of rooms or apartments coming within the scope of the laws and to enforce the provisions of the laws, and in some cases to report insanitary conditions, infectious or contagious diseases, etc., to the health officers. In Illinois this class of work is prohibited in rooms or apartments in tenement- or dwelling-houses except by members of the family living therein, and in Missouri such work is prohibited for more than three persons outside the members of the family; but no further restrictions are made in these cases. In the remaining states enumerated, however, members of the family may engage in such work only under certain conditions. Provision is also made for the regulation of work in shops not connected with living- or eating-rooms, but located in tenement- or dwelling-houses, or in buildings in the rear of the same. In Maryland, Massachusetts, and New York families must procure a license from the factory inspector before being permitted to perform the above-mentioned work in their dwellings, and manufacturers may not give them work unless they have such licenses. In Indiana, Maryland, Michigan, New Jersey, New York, Pennsylvania, and Wisconsin the law prescribes that no person, partnership, or corporation may hire or employ persons to work in rooms or apartments in tenement- or dwelling-houses or in buildings in the rear of such houses without a written permit or license from the factory inspector. In Connecticut and Ohio the laws make no provision for the issuance of a license. In Massachusetts a license is not required for work done in rooms or apartments not connected with living- or sleeping-rooms and which have a separate entrance.

Legislation

The written permit or license obtained from the factory inspector is not issued until after an inspection has been made of the premises and they have been found in a sanitary condition and fit to work in. Usually the license or permit must specify the maximum number of persons that may be employed in the room and it must be conspicuously posted. This number is one person for every 250 cubic feet of air space in the daytime and, usually, one person for every 400 cubic feet at night. The licenses may be revoked at any time when the public health requires it.

In all the states the factory inspectors have access to the rooms or apartments in tenement- or dwelling-houses where clothing, etc., are made, including in most cases rooms where only members of the family are engaged in such work. This is for the purpose of seeing that the regulations regarding cleanliness, light, heat, ventilation, overcrowding, etc., are enforced, and that the articles made are not exposed to infection or contagion and are free from vermin. In Illinois, Massachusetts, Michigan, New York, and Wisconsin the factory inspectors or the boards of health may seize, condemn, or destroy articles containing infectious or contagious matter or vermin which are found either in workshops or exposed for sale. In Michigan health officers and physicians are required to report to the deputy factory inspectors of their respective districts all cases of contagious or infectious diseases coming officially to their knowledge. In Massachusetts garments made in tenement- or dwelling-houses in which families have not procured a license, and in Missouri and New York goods made in violation of the law must be conspicuously labeled "tenement-made." In Missouri, if made under unclean or unhealthy conditions, they must be labeled "made under unhealthy conditions." These provisions apply to articles made outside as well as within the state.

In addition to the requirement in most states that persons, firms, or corporations giving out work to be done in tenement- or dwelling-houses must procure licenses or see that the persons performing the work have procured licenses the states of Maryland, Massachusetts, Michigan, Missouri, New York, Ohio, Pennsylvania, and Wisconsin require such persons, firms, or corporations to keep a register of the names and addresses of all persons to whom work is given or with whom they have contracted for the performance of work to be done in tenements or dwellings. Penalties of from \$20 to \$500 or imprisonment of from ten days to one year are prescribed for violation of the sweat-shop laws.

But the trouble is with the enforcement of laws. Says Dr. Daniel:

We have laws which if enforced would obliterate every sweat-room, great and small, in New York. To enforce these laws would require an army of inspectors working day and night. . . . I have a list of tenements licensed by the Labor Bureau in my neighborhood. I have been in thirty-eight of these houses; the license was posted in twelve. In one of these licensed houses I have attended a case of measles; there are two families in the apartment; the notice of the contagious disease was posted on the door; two women were finishing trousers within; one day I found the sick child lying on a bundle of the trousers; this is a common occurrence. There is also a clause forbidding the employment of any but members of the family; not only is this not obeyed, but

the work is carried to other apartments and even to other houses. The old law placed the responsibility of manufacturing on the worker and the manufacturers. The new law takes the responsibility off the worker and puts it on the landlord. On Jan. 9th, according to the daily papers, a raid was made by twenty-two inspectors in Elizabeth Street. The people were duly frightened, much of the work was hidden, and to my personal knowledge in the evening was being done in inside bedrooms, with doors locked. Fresh work I saw carried in and finished in about the same way that the people would have made counterfeit money. The next day and since, it is being done openly, outlooks being posted in different parts of the house who will give the alarm in their own language, and work will be again hidden should another inspection be made. Is there any remedy? I believe that a law absolutely forbidding any manufacturer to have any part of his work done in a tenement-house could be enforced.

GREAT BRITAIN

The following important statements are condensed from a Fabian tract (Jan., 1907), "Home-working and Sweating," by Miss B. L. Hutchins:

The phrase, the sweating system, is misleading. All experts agree that there is no one industrial system coextensive with or invariably present in the sweated trades. Mr. Booth expresses this by saying that it is not with one but many sweating systems we have to deal; Mr. Schloss says that no sweating system whatever is discoverable; and the House of Lords committee, while reporting that the evils complained of could "scarcely be exaggerated," said that they had been unable to find any precise meaning attached to the phrase. An inquiry into sweating resolves itself, therefore, into an inquiry into the conditions under which the "sweated industries" are worked. Here at least a painful and striking uniformity is met with, and accepting it as a starting point, the Lords committee defined sweating as:

1. Unduly low rates of wages.
2. Excessive hours of labor.
3. Insanitary state of the work places.

Mr. Schloss has added the important point, taxing of working power to an unreasonable extent, or getting sixpenny worth of work out of fourpenny worth of pay ("driving").

The unfair advantage enjoyed by the sweater is of two kinds: first, the evasion of factory legislation; second, the extreme lowness of the wages paid. Of the low wages so much has been heard that it is hardly necessary to labor the point further. We take a few instances at random from the *Daily News Exhibition Handbook*.

A. Trousar maker, widow with four children, works ten or twelve hours a day; her best earnings (exceptional) are 10s. 6d. a week; more often 3s. or 4s.; receives parochial relief.

B. Match-box maker, works twelve hours a day, earns on an average less than 5s. a week. Highest earnings 8s. 2d. for a full week including Sunday.

C. Button carder. Two old people work together, earn 3s. 6d. per week.

Such instances could be multiplied *ad nauseam*. The Cradley Heath chain makers, after deducting cost of fuel, earn only 5s. to 6s. weekly for hard work, of a kind really skilled in its way, and not yet replaceable by machinery. The writer has personally visited home workers in London, Birmingham, and Cradley Heath, and has met with one, a skilled waistcoat maker, who was paid a living wage. The next most favorable instance was that of a remarkably quick, capable girl, making girls' frocks, lined throughout and trimmed, at 8d. each, deducting cost of cotton. She said she could make five or even six a day on occasion. In match-box making and similar wretched trades, about 1d. per hour seems to be what the piece rates yield. The lowest depths of all perhaps are reached by workers who sew hooks and eyes, buttons, etc., on cards. Carding hooks and eyes I have found paid at 14d. per gross cards in Birmingham. The employer was threatening to reduce the price to 10d., for there were middlewomen who could farm the work out to "very poor people," and thus cut the recognized price of 14d. per gross. The average earnings of women in this work are only about 3s. 3d. weekly, even when they work long hours. In all these small home industries the wages appear to tend steadily downward, altho in factory work women's wages have been rising for a considerable period.

The pathetic part of the sweated industries is that it is often the very virtues of these people that are their ruin. Miss Clementina Black, in her introduction to the cases investigated and tabulated by the Women's Industrial Council, says "many of them are of the highest respectability and maintain a standard of conduct and cleanliness quite heroic. . . . The majority of these forty-four women are industrious, even painfully industrious; most are thoroughly respectable; scarcely one is paid a living wage." They will sit up all night, and work for what is given them, and submit.

Nothing comes home more forcibly to the investigator of home work than this fact that many of the women would not take work out at all if their husbands could obtain a decent remuneration. A great deal of sweated work by

women is simply an indirect result of the underpayment or irregular employment of men.

Successive inquiries and reports have brought these conditions before the public. The Commission on Children's Employment, 1863-67, advised the extension of the Factory Act to homes in which certain industries were carried on. But no government has had the courage to take such a step, each in turn having been daunted, partly no doubt by a vague dread of infringing "the sanctity of the home," but still more, probably, by the practical difficulties of administering such an act. The law in regard to home work consists of a few very mild provisions.

Private consumers' league cannot exert much influence by issuing "white lists," for the reason that trade is so complicated that it is practically impossible to trace production.

Remedies Some good, perhaps, might be done by the requirement of a label on goods for sale, stating that the goods were tenement made, in unhealthy conditions, or the reverse. This plan has been tried in Massachusetts and Pennsylvania, it is said, with some success; but the extreme ease with which a label can be forged or destroyed makes the provision of doubtful value.

Protection of home industries is sometimes urged as a possible remedy for sweating. The evidence collected for the Berlin exhibition of sweated industries showed that sweating is quite as rampant in protected Germany as in free-trade England; colonies of home workers in Chicago and New York where even the very high tariff does not make wages or conditions any better than in the worst parts of London. Regulation of sweating would do far more for trade than any import duty.

Restraint of immigration is often urged as a remedy for sweating, but the Aliens Act of 1905 achieved little or nothing, and it is unlikely that even a much more drastic act would really check the evil.

Short of regulating wages, we do not believe that any real or adequate control of the sweater can be maintained. Undoubtedly efficient sanitary inspection of homes used as workrooms may do some good indirectly, in that it protects the consumer from the very real danger of dirt and infection, and also in that it checks the giving out of work in some degree, and is likely to insure more work being done in factories and workshops, "to which the employer has the right of access and control." Two competing suggestions are now before the public; these are known respectively as the Tenant Bill and the Women's Industrial Council's Bill, the latter usually introduced jointly by some friends or members of the Women's Industrial Council and of the Scottish Council for Women's Trades. Mr. Tennant's Bill aims at placing the responsibility for the conditions under which work is done in home workrooms on the giver-out of work; and would place the administration in the hands of the local sanitary authority, who already receives the outworkers' lists. The Women's Industrial Council Bill involves more of an innovation; it would place inspection of outworkers under the factory inspectors, and all outworkers would have to produce a certificate showing that their workrooms had been inspected and found suitable for the work to be carried on, having regard to the health of the persons to be employed therein. This measure would involve a considerable increase in the inspecting staff, but as that is for other reasons highly necessary and desirable, it does not in itself constitute an objection.

To those who follow the argument that sweating, though apparently an inexpensive method of production, is ruinous to the community through the physical and moral deterioration induced in the sweated and their workers, it will be at once evident that the abolition of sweating is an important incidental advantage of direct public employment. The establishment of the Army Clothing Factory has saved thousands of workers from sweating-dens without any increase in the cost of production. The enlargement of that factory so as to produce in it not only some but all the clothing required for the army, militia, and volunteers would rescue thousands more from their present fate.

And if local authorities followed suit—if the London County Council were given power to set up its own clothing factory, and to supply other local governing bodies—if it became the practise to manufacture all asylum, hospital, police, and fire-brigade uniforms required by any town or county council or other public body, either in its own factory or in that of some other public body—if a similar course were pursued with regard to boots and shoes, saddlery, and general leather work, chains, furniture, and other commonly sweated wares, part, at least, of the evil would disappear.

But however rapidly we press on the establishment of public factories for the supply of public wants, many public bodies will, for a long time to come, have to buy goods which are at present usually the product of sweating.

There is no person in this—or in any of the states that are called civilized—who does not partake of the proceeds of underpaid labor; and the conditions of such labor are not growing better; they are, if anything, growing worse, and underpayment is rather spreading than decreasing.

The writer believes that New Zealand alone is working out a complete solution of the problem. In New Zealand and some other colonies any work-room where two or more

persons are employed, the employer counting as one, constitutes a factory within the meaning of the act. Those who have studied the history of factory legislation can see that this is by far the best method, and the only one that can check sweating in home work and prevent unfair competition with well-conducted industry. Yet this is not all and mainly important because of the New Zealand system of wages boards, minimum wages, and strict government control of wages and labor conditions.

SWEDEN: A monarchy of Europe. Area, 172,876 sq. m.; population in 1906, 5,337,455, or 30.43 per sq. m., in 1905. The principal cities with population (1906) are: Stockholm, 332,738; Göteborg, 156,927; Malmö, 75,691; Norrköping, 45,528; Sölle, 30,988; Helsingborg, 31,404.

I. Statistics

The population of Sweden shows a slow but healthy growth; it was in 1890—4,784,981, an increase of 0.50 per cent per annum over 1880; 1900—5,136,441, an annual increase of 0.71 per cent. Of the population in 1905 there were 2,584,564 males and 2,710,321 females. In 1900 there were of males: single, 1,566,868; married, 838,999; widowers, 98,647; divorced, 1,922; females: 1,566,668 single; 847,252 married, 212,461 widows, 3,624 divorced. Births seem to have somewhat decreased. There were 139,370 in 1901 (of which 16,385 were illegitimate) and 135,400 in 1905. Marriages are also decreasing (31,278 in 1901 and 30,800 in 1905). Deaths (exclusive of still-born), 82,772 in 1901, and 82,400 in 1905.

The population of Sweden is almost entirely of the Scandinavian branch of Arians, with the exception of (1900) 22,138 Finns and 6,983 Lapps; there were also 35,627 foreigners, mostly Germans, Danes, and Norwegians. Sweden lost by emigration: 1900—20,661; 1904—22,384; 1906—24,705. Of these numbers 16,209; 18,533 and 21,442 came to the United States.

Religion and Education.—The vast majority of Swedes belongs to the State Church (Evangelical Lutheran). The Church numbered (1900) 5,072,792; extended to all religions, and no civil disabilities attach to those citizens not belonging to the State Church. The latter is supported from the income of the Church lands, and by contributions of the parishes.

Education is well advanced in Sweden; public elementary instruction is compulsory and gratuitous. In 1904 there were 12,778 elementary schools with 727,008 pupils and 18,274 teachers; the expenditure was 27,055,369 kroner. Sweden had (1905) 82 public high schools with 20,516 scholars; 31 people's high schools with 1,666 scholars; 14 normal schools with 1,412 students; 8 technical schools with 3,400 students; 10 navigation schools with 712 boys. There were, moreover, schools for defective and backward children. Sweden has two universities, Upsala with 1,729 and Lund with 817 students, in 1905.

Occupation is chiefly agricultural; since about 2,380,000 people depend on farming for their living. Manufactures support about 1,210,000 people; trades and servants about 462,000; transport and locomotion, 414,000.

Industrial Statistics

The land suitable for cultivation was (1904) divided among 350,851 owners or tenants; 86,925 of these had 2 hectares or less; 223,164 between 2 and 20; 33,432 between 20 and 100; 3,225 over 100. The area under cultivation constitutes only 8.8 per cent of the total area; 3.4 per cent consists of grass and meadow land; 51.5 is under forests; 36.3 per cent are mountains or snow-covered, and non-productive. The crops produced in 1905 were: wheat, 1,909,800 hectoliters; rye, 2,881,

500; barley, 4,778,900; oats, 21,624,300; mixed grain, 3,761,000; pulse, 659,800; potatoes, 26,366,200. The total value of the crops in 1904 amounted to 243,100,000 kroner. Live stock in 1904 numbered: 546,943 horses; 2,545,583 cattle; 1,105,903 sheep; 796,572 swine.

Mining is an important industry in Sweden. The output in 1905 was 4,364,833 tons of iron ore, producing 530,776 tons of pig and 369,771 of bar iron; 8,397 tons of silver and lead ore; 39,255 tons of copper ore; 56,885 tons of zinc ore; 1,992 tons of manganese ore; and 20,762 tons of sulphur pyrites. Besides 55 kilograms of gold, 606 of silver, 575,527 of lead, 1,385,098 of copper, and 305,000 of zinc were produced in the smelters. Considerable coal has been found in southern Sweden, yielding (1905) 322,384 tons. Mining gave employment that year to 31,222 persons.

Forestry is managed by the State in a scientific manner. The public forests have an area of 6,642,909 hectares of timber land, including 1,100,000 hectares of crown forests. There were 1,370 saw- and planing-mills in 1904 with 41,849 employees. The output of lumber was valued at 153,196,088 kroner. Furniture factories numbered 441 with 10,949 workmen; output valued at 23,196,349 kr. The output of 135 wood-pulp factories with 8,333 employees amounted to 45,035,375 kr.; 67 paper and pasteboard factories with 7,031 work-people had an output valued at 432,477,477 kr.

Manufacturing is chiefly in iron and machinery; 19,509 people were employed in 636 iron- and steel-mills and produced an output valued at 61,727,900 kr.; 424 machinery shops employed 19,710 people with an output of 55,294,000 kr.; 1,670 flour-mills with only 4,517 employees produced an output to the value of 100,362,000 kr.

Commerce and Shipping.—The imports in 1900 and 1905 amounted to \$34,935,110 kroner and \$32,084,457; exports, 391,334,962 kr. and 450,211,733. The customs duties amounted to 57,731,764 kr. and 60,366,568 respectively. The imports consisted (1905) principally of metal goods, machinery, etc., 75,340,683 kr.; minerals, chiefly coal, 73,841,176; corn and flour, 62,587,043; raw textiles, 55,351,198. Exports were chiefly: timber (wrought and unwrought), 201,813,518 kr.; hair, hides, and other animal products, 51,466,500; metals, 49,962,098; minerals, 40,668,344; machinery and metal goods, 37,729,192. Imports were principally from Germany, 224,364,938 kr.; Great Britain, 144,035,143. Exports to: Great Britain, 159,398,772 kr.; Germany, 85,206,640. The mercantile marine consisted (1905) of 1,950 sailing vessels with 265,748 tons, and 1,019 steam vessels with 408,124 tons. Göteborg was the largest port with 299 vessels and 147,707 tons; Stockholm second with 226 vessels and 95,817 tons.

II. Constitution and Government

Sweden is a constitutional monarchy. The present king is Oscar II. (born 1829, succeeded to the throne Sept. 18, 1872). The king has certain powers in political matters, but in others he (with his cabinet) exercises that power in conjunction with the Diet. Every new law must, however, have the assent of the crown. The right of imposing taxes is vested in the Diet.

The Diet consists of two chambers, both elected by the people. The First Chamber has 150 members who are elected by certain provinces, towns, and cities; they must be thirty-five years old; have taxable property worth 80,000 kroner, or an income of 4,000 kr.; they are elected for 9 years, and give their services free. The Second Chamber consists of 230 members; 80 elected by the towns and 150 by rural districts. Electors must be 21 years of age; possess real estate worth 1,000 kr. or farm land worth 6,000 kr., or pay an income tax on 800 kr. The number of electors in 1905 was 432,099, or 8.2 per cent of the population; but only 217,759, or 50.4 per cent of the electors, actually cast ballots. The members of the Second Chamber are elected for 3 years; receive 1,200 kr. plus expenses in the case of extra sessions.

The municipalities and provinces enjoy much freedom in their local affairs.

Finance

The revenue of the State comes chiefly from customs, 57,000,000 kr. (1906); imposts on sugar, spirits, etc., 32,000,000; income tax, 20,950,000. The total revenue for 1906 was 179,270,000 kr.; expenditure, 179,270,000. The principal

items of the expenditure were: Army, 51,293,600 kr.; navy, 22,455,700; Ministry of the Interior, 35,610,800; education and ecclesiastical affairs, 18,884,400.

The total length of railways was 7,677 miles in 1903; of which 2,612 belonged to the State.

The receipts of all railways were 100,223,312 kr.; expenses, 66,575,691; surplus, 33,647,621. They carried 36,296,648 passengers and 24,490,837 tons of freight. The total length

of telegraph and telephone lines was (1904) 19,487 miles with 127,170 miles of wire; of these 14,685 miles of line with 95,118 miles of wire belonged to the State. There were 2,383 telegraph offices.

The postal service had (1904) 3,419 offices; receipts, 16,563,956 kr.; expenses, 14,635,991; surplus, 1,927,965.

The Army is just being reorganized, and will be on its new status by 1914. The new scheme provides for a *modified militia* with conscripts being called out for an initial training of 150 days in the infantry and artillery and 281 days in the cavalry, and with 30 yearly for the next three years.

III. Social Reform

Sweden as an agricultural country has not developed far in industrial reform. Educational and temperance reforms began earlier (see TEMPERANCE; NORWEGIAN COMPANY SYSTEM; GOOD TEMPLARS), and poor relief is older still. Homes for the shelter of poor children still exist which were founded early in the sixteenth century. The present poor-law dates from 1843, revised in 1871, and lays the burden on the parishes. Various private charities, however, supplement this.

In Stockholm a society called Föreningen för Vålgörenhetens Ordmande (Society for Organizing Charitable Relief) was founded in 1889 on the same leading principles as the English and American charity organization societies. In Stockholm alone there are 400 different charitable societies.

The oldest is the "Skydds-föreningen" (Society of Protection), started by Frederika Bremer and whose president is the queen; its members visit and help the poor, their first object being the children. "Arbetsstugor" (workshops for children), where children from seven to fourteen years of age are taught sewing, knitting, basket-making, and other kinds of hand-work, are spreading over the country. A considerable number of "so-called" model houses for workmen—after the Octavia-Hill system—have been erected.

"Vandrande Sparkassor" (moving savings-banks) are formed by visitors in needy neighborhoods to induce the saving of pennies.

Cooperation, tho slow in beginning, is now rapidly spreading in Sweden. There were, in 1906, besides unregistered societies, 382 retail societies, 410 agricultural, 373 dairy and poultry, 903 building societies, 155 productive, and 301 miscellaneous. A wholesale society has been established. The growth is very rapid.

Trade-unions began in Sweden in 1880. In 1898 the unions formed into a national organization, composed of twenty-four federations with about 60,000 workers. Various *Houses of the People* (similar to those in Belgium) have been started. The one at Stockholm is on an especially large scale. Industrial legislation, however, has been backward and the unions have had to struggle hard for their rights. A principal aim

has been universal suffrage, and in 1902 there was a general strike for this purpose, only very partially successful.

Socialism entered Sweden with a tailor from Denmark, Auguste Palm. A paper, *Tiden* (Times), was started and the movement spread fast. In 1885 the Swedish trade-unions became connected with the Socialist movement, as they are in all Scandinavian countries. Since 1898 this has been compulsory in Sweden. In 1893 a *folk-essdag* (congress of the people) was organized. In 1896 the Socialists elected a deputy, Branting. In 1905 they had fifteen deputies and cast some 30,000 votes. The Socialist Party numbers, however, 55,000 paying members, only a moiety of whom can vote, because of the high property qualification (taxed on an income of 800 kr.).

The trade-unions numbered 1,300 with a membership of 80,000, or 25 per cent of the industrial workers. Of these, 850 unions with 42,000 were in the National Union. The Swedish Socialist includes 3 dailies, 10 periodicals, and 20 trade-union papers.

Among the important Swedish social reform societies are the:

Central förbundet för Socialt arbete (Central Alliance for Social Work), 6 Lastmakargatan, Stockholm.
Föreningen för Valgrenhens Ordande (Charity Organization Society), Stockholm.
Cooperative Society, 6 Lastmakargatan, Stockholm.
Temperance Society, 12 Tegnergatan, Stockholm.
Främlingar-Bröders Förbundet (Woman's Questions), 54 Drottninggatan, Stockholm.
Folkets Hus (Trade-Union House of the People), 14 Barnhusgatan, Stockholm.

Bain (1905); *Sweden and the Swedes*, by W. Thomas (1898); *Aperçus Statistiques Internationaux*, by G. Sundberg (1906).

SWINTON, JOHN: Journalist, labor leader; born 1830 in Illinois; learned the printer's trade. In 1850 removed to New York City; studied law and medicine, but returned to journalism and was made chief of the editorial staff of the *Times*, a position he held through all the Civil War and until 1869. After that was with Mr. Greeley on the *Tribune* till 1879, and then was chief writer on the *Sun* for several years. In 1883 he established *John Swinton's Paper*, a radical labor organ which acquired for a time a great influence, but unfortunately in 1886 the paper failed. Mr. Swinton then returned to ordinary journalism. In 1874, nominated for Mayor of New York on a workman's ticket, he received but 200 votes. He was, however, always a favorite speaker, and a popular leader in all New York labor meetings to the last. He died in 1901.

SWITZERLAND: A republic of Europe. The three cantons, Uri, Schwyz, and Unterwalden, entered into a defensive league Aug. 1, 1291. Since then the republic has grown until it comprises twenty-five cantons with an area of 15,976 sq. m., and a population of 3,489,689 in 1906, or 218.4 per sq. m. The corresponding figures of the population for 1900 were 3,315,443 and 207.5.

The principal cities with population in 1905 are: Zurich, 180,843; Basel, 127,987; Geneva, 114,547; Bern, 71,748; Lausanne, 53,209; St. Gallen, 51,766.

I. Statistics

Births in 1905 were 98,057; marriages, 26,269; deaths, 65,208 (including still-births); surplus of births over deaths, 32,853, a surplus which has

been decreasing; in 1901 it was 37,010. Illegitimate births in 1905 were 4,469, or 4.6 per cent of the total; that of divorces, 1,206. Of the population over fifteen years of age there were in 1900: 1,112,111 males—503,770 single; 542,119 married; 61,065 widowers; 5,157 divorced; 1,174,893 females—481,499 single; 539,595 married; 144,532 widows; 9,267 divorced.

Switzerland has lost less heavily by emigration than other European countries, the figures for five years being: 1901—3,921; 1902—4,707; 1903—5,817; 1904—4,818; 1905—5,049. In 1905 over 85 per cent, or 4,349 of the total emigrants went to the United States; 554 to different parts of South America. There were 383,424 foreigners resident in 1900.

Switzerland is peculiar in recognizing three languages as official: German, French, and Italian being spoken in the *Bundes-Versammlung* (q. v. below). German is, however, the principal language, being spoken by 2,312,949, or nearly 70 per cent, in 1900. French was spoken by 730,917; Italian by 221,182; Romanish (in the Grisons), by 38,357.

Religion is not required for citizenship, the Constitution of 1874 permitting any or no religious affiliation. No State taxes are levied for any Church; no bishoprics, Roman or other, can be created on Swiss territory without the consent of the Confederate authorities. The Jesuits are debarred, and the foundation of new religious orders and convents is forbidden. The Protestants—chiefly Reformed or Calvinistic—numbered in 1900 about 59 per cent, or 1,916,157; the Roman Catholics about 40 per cent, or 1,379,664. There were 12,264 Jews.

Education is not supervised by any central authority, except that it is compulsory since 1874; it is, however, under the civil authorities. The expenses are borne entirely by the communes in some cases; in others the cantons share them. In Roman Catholic cantons the proportion of school-attending children to the whole population is 1 to 9; in Protestant, 1 to 5; in mixed, 1 to 7. Some Roman Catholic cantons have never enforced the school laws properly. The age for school attendance is, moreover, shorter in the Catholic cantons. In 1905 there were only 0.09 per cent of the contingent for military service who could not read, and 0.43 per cent who could not write. In 1904 there were 862 infant schools with 44,000 pupils and 822 teachers; 4,665 primary schools with 492,768 pupils and 10,977 teachers; 598 secondary schools with

Education 43,842 pupils and 1,772 teachers; 40 "middle" schools, or *Realschulen* and *Gymnasien* with 11,824 pupils and 841 teachers; 65 "normal" or *Lehrer-Seminarien* with 2,813 pupils; "pensions" or "boarding-schools" for girls, 2,076 pupils. The so-called *Fortbildungs Schulen* or evening schools number 54,289 pupils. There are besides commercial, technical, and agricultural schools. (See article, EDUCATION.) Six universities—Basel established in 1460, being the oldest—make provision for higher education.

Occupation.—Thirty-seven per cent are engaged in agriculture, 41 in industries, and 11 in trade. In 1907 1,067,905 were engaged in farming or allied and dependent occupations; the building trades and furniture manufacture employed 426,401; commerce, hotels, boarding-houses, etc., 285,486; metal works, 275,892; textile industries, 270,114; clothing and dressmaking,

208,757; transportation, 167,278; food supply, etc., 129,797. There were in 1901 6,080 factories with 242,534 employees.

Industries are chiefly agricultural. The soil is very evenly divided among the population. An estimate places the number of peasant proprietors at 300,000, with about 2,000,000 people. The estates are necessarily small, since 28.4 per cent of the total area is unproductive. Of the productive area 35.8 per cent are grass land and meadows; 29

Industries and Commerce

per cent forest; 18.7 per cent under fruit; 16.4 per cent under crops and gardens. Notwithstanding the large agricultural population, the bulk of the food crops consumed is imported.

The peasant proprietors are engaged chiefly in the manufacture of cheese, condensed milk, cream, etc.; 278,432 quintals of cheese and 306,589 quintals of condensed milk were exported in 1905. In the southern cantons viniculture is a thriving industry, 1,267.45 hectoliters of wine being produced in 1904, on 28,831 hectares, to the value of 45,009,470 francs. Live stock in 1903 numbered 161,936 horses, 2,080,297 cattle, 219,438 sheep, 555,261 pigs, and 354,634 goats.

Forestry is under federal supervision. The law of 1876 placed about 1,119,270 acres, or 55 per cent, of forest land under federal regulations, according to which this area can never be reduced. Trees are carefully replanted—22,704,570 in 1905; timber is cut according to scientific principles—1,839,558 cubic meters in 1905. There are about 163 establishments for pisciculture, the fry going chiefly to hotels. There are 5 salt-mining districts, the output in 1905 being 554,507 quintals; 186 breweries produced 2,264,652 hectoliters of beer. Alcohol manufacture is a federal monopoly, 56,355 quintals of drinkable spirits and 74,264 quintals of methylated spirits for use in the arts being sold in 1905.

Commerce is principally special; the imports (1905), 1,458,321,700 francs; exports, 1,007,822,756. The principal items in the import figures for 1905 were: Foodstuffs, tobacco, spirits, etc., 371,397,433 fr.; silk, 154,339,265; useful metals, 114,432,251; cottons, 97,221,225; mineral substances, 90,933,377. Exports were: silk, 250,728,057 fr.; cottons, 185,840,814; clocks and watches, 132,743,514; foodstuffs, tobacco, spirits, etc., 129,126,944; machinery and carriages, 61,201,625. Imports (1905) were: From Germany, 440,798,593 fr.; France, 274,399,129; Italy, 176,901,230; Austria-Hungary, 91,524,476; Russia, 77,075,155; Great Britain, 68,803,389. Exports: To Germany, 232,028,577 fr.; Great Britain, 175,193,814; America, 170,439,166; France, 119,600,221; Italy, 56,981,041; Austria-Hungary, 54,369,866. The customs duties on imports and exports were, 1903: 53,361,590 fr.; 1906, 62,156,690.

Switzerland has largely gained in wealth in the last fifty years. Its wealth, excluding State property, is estimated at \$3,400,000,000.

II. Constitution and Government

In 1815 the perpetual neutrality of Switzerland and the inviolability of her territory were guaranteed by the Congress of Vienna. The Constitution then adopted has been changed in 1848, and lastly in 1874. It provides for the revision of the Constitution by the ordinary forms of federal legislation, with compulsory *referendum*; or by direct popular vote on the *initiative* of 50,000 citizens. The federal government has all the rights, prerogatives, duties, and obligations of a sovereign government, tho the enforcement of law, justice, public works, and education is left to the cantons. There are two federal chambers, the Senate or *Ständerat* consisting of one to two representatives from each can-

ton; and a Chamber of Deputies or *Nationalrat*, consisting of 167 representatives, chosen in direct election, at the rate of one member for every 20,000 of the population.

Legislature

The senators receive their honorarium from the cantons—on an average 20 francs per diem—the deputies from the federal funds at the rate of 20 fr. for each day on which they are actually present, plus traveling expenses. The life of the Chamber expires by limitation; a new election by ballot being required every three years. Citizens of twenty-one years of age may vote; and every voter may be elected a deputy, except clergymen. When the two chambers are in session the assembly is called *Bundes-Versammlung*, or Federal Assembly. The legislative power rests in either of the two chambers; but the principles of the referendum and initiative are in force. By the *initiative* (on the demand of 50,000 voters) a popular vote must be taken (the referendum). Legislation, too, by the Assembly may be vetoed by the *referendum* (on demand of 30,000 voters, or of eight cantons). (See REFERENDUM IN SWITZERLAND.) The principal parties are Right (Roman Catholic), Center (Liberal), Left (Radical), and Socialists. The chief executive power rests in the *Bundesrat*, or Federal Council—a committee of seven, elected for three years by the Federal Assembly. The members of this committee cannot hold any other federal or cantonal office, nor engage in any gainful occupation. They frequently introduce new measures in the Assembly, and take part in its deliberations, but are not allowed to vote. The president and vice-president of this council, elected annually, are the president and vice-president of the confederation. They represent the republic, but have no more power than their confrères. The members of the council form the cabinet of the government. Salaries: The president's salary is 13,500 fr.

The local government varies greatly in the different cantons, each being supreme in matters not delegated to the federal authorities.

Finances.—The federal government has no power to levy taxes directly. Its principal revenue comes from the customs, the alcohol monopoly, and the postal, telegraph, and railroad services. Even part of this revenue is paid back to the cantons. Of the revenue from the alcohol monopoly, each canton must use one tenth for combating alcoholism within its own territory. Several federal manufactories yield part of the revenue; also the tax for exemption from military service. This is levied by the cantons, and divided equally between them and the confederation. The Constitution provides, however, that the federal government may, in extraordinary cases, levy a rate upon the various cantons according to a settled scale. The total revenue in 1901 was: 101,924,682 francs; 1905, 129,303,264. Expenditure: 105,533,089 fr. and 116,716,180, respectively.

The principal item of expenditure without any returns was for military purposes; in 1907 it was estimated at 39,562,156 fr. Internal communication is good. There were (1905) 2,936 miles of railroads—1,470 belonging to main lines, 1,423 to secondary and tramways, 43 to foreign. The federal government owned 1,516 miles. The receipts on the latter amounted to 120,677,369 fr.; working expenses to 80,156,945; surplus, 40,520,424. There were in

Railways, Posts, and Telegraphs

all 5,620 miles of telegraph lines with 27,597 miles of wire. The State owned about half of them. The receipts on the latter were 11,033,151 fr.; expenses, 10,877,151; surplus, 426,000. There were in the same year 1,677 post-offices. Receipts, 44,549,955 fr.; expenditure, 40,053,837; surplus, 4,496,118.

The army of Switzerland is essentially a militia. Military service is compulsory, nominally from 17 to 50 years; practically from 20 to 32. About 143,000 men are eligible to a call to arms in case of need.

III. Social Reform

Switzerland, in many ways, tho by no means in all, leads the nations in social reform. In no country are democratic political institutions so fully developed; perhaps in no country is there so much industrial democracy.

The Swiss referendum comes down from the old *landsgemeinden* of ancient times and was used almost in its modern form in Bern and Zurich as early as the fifteenth century. The compulsory referendum and the initiative were adopted in some of the cantons in 1868. The

Political Reforms

federal referendum was established in 1874 and the federal initiative, 1891. Proportional representation was adopted at Ticino in 1892, and has been adopted now by most of the cantons (see DIRECT LEGISLATION; REFERENDUM AND INITIATIVE; PROPORTIONAL REPRESENTATION). Another important and unique political institution in Switzerland is her political recognition of organized labor. In 1887 the office of Workman's Secretary was founded, its incumbent to be practically a member of the federal cabinet, and to be paid by the government, but to be elected by the Swiss labor-unions, thus to some extent making them a recognized part of political Swiss institutions. A Working Men's Federation has been formed, composed of one delegate from each labor organization which has 250 members. This Federation elects the Workman's Secretary (for many years Herman Greulich). It has also a congress (*Arbeitertag*), which meets triennially, a council (*Bundesvorstand*), and an executive (*Ausschuss*).

Swiss municipal institutions are, however, equally progressive with national institutions.

Cities like Zurich and Basel in German, and Geneva in French, Switzerland, are among the most progressive municipalities in the world.

They care minutely for the housing of the working classes; they strive to give work to the unemployed; they have municipalized most of the natural monopolies—they thus receive large municipal revenues with low rates of taxation; among other things they have developed industrial schools of the world. Geneva had an *École de dessin* as early as 1751 and Basel a public school for drawing in 1762. Other cities followed, Bern in 1766. In 1848 the confederation founded a university and polytechnic school (1905, 1,293 pupils) at Zurich (opened 1855). In 1884 the federal government commenced subsidizing local schools, with the result that Switzerland has, for her size, probably the best industrial schools in the world.

Switzerland has also done pioneer work in institutions for the insurance of the unemployed, tho thus far without large success. Bern estab-

lished a plan of voluntary insurance under municipal auspices in 1895, after some preliminary efforts by local labor organizations. The benefit granted, however, to the unemployed was very little and few workmen have availed themselves of it—only about 600 in recent years, mainly in the building trades. St. Gall, in 1895, tried a somewhat similar plan, but made insurance in it compulsory upon working men. It, however, was never popular and was given up in 1897. In 1901 Basel (having voted against a municipal plan) commenced subsidizing a workmen's unemployment fund which was started, and this has endured, but without large results, and losing in membership of late years.

Much more successful have been the Swiss municipal or cantonal employment bureaus, founded on the German method. St. Gall in 1887, Bern in 1888, Basel in 1889, and other cities later. (See PUBLIC EMPLOYMENT BUREAUS.) In 1905 they placed 44,243 persons out of 59,355 who sought work. Connected with these are the relief stations for workmen traveling in search of work, also on the German plan (see RELIEF STATIONS). They cover many of the cantons with a network. There are besides numerous municipal or private philanthropic institutions, all largely subsidized by the State. Examples are the Old People's Refuge at Bern, the Municipal Orphanage at Zurich, the Municipal Workshop (*Armenanstalt*) at Bern, and labor colonies at Tannenhof and Herdern. The Tannenhof colony was founded in 1889; that at Herdern in 1895; neither have had large success. They attract but a low class of laborers, having from twenty to fifty inmates usually, and cannot show large results with these. For pauper children Swiss cities do better, mainly on the boarding-out plan. Peculiar to Switzerland are the societies for public utility. This is the name by which Mr. W. H. Dawson (see his "Social Switzerland") translates *Gemeinnützige Gesellschaften*. They are of long standing, in Bern since 1759 and Basel since 1777. They are in a way agencies for various measures, charitable and educational. They maintain gymnasiums, baths, schools, classes, etc., afford relief, and do not a little in developing model dwellings. In this line, however, the municipalities do more, notably Bern, at Wylerfeld (a municipal industrial colony). The Messrs. Suchard (chocolate manufacturers) have a private "model village" at Neuchâtel, as have Reiter & Co. at Töss. Courts of arbitration and boards of conciliation, with *conseils de prudhommes* at Geneva, are other measures developed in Switzerland between capital and labor.

Cooperation began early in Switzerland, and has had considerable development. Distributive societies were the first started. The

Cooperation and Trade-Unions *consumvereine* of Zurich date from 1858. There were, in 1903, some 1,800 cooperative agricultural societies and 1,200 productive societies.

Including the cooperative banks there were some 4,400 cooperative societies in all. The *Genossenschaftliche Volksblatt* has some 100,000 readers. Trade-unions have also reached considerable development. The *Schweizerische Gewerkschaftsbund* has about 50,000 members; 30,000 organized in the railroads and transportation are not affiliated with this. (There are 24 trade-union journals and 26 workman's secretaries of various organizations. Nevertheless, it is said

that the unions still reach only 12 per cent of labor.

The fact is that Switzerland, where land is widely distributed and even factory workers have small allotments, on which they work a portion of the time, has not developed the class consciousness of many more purely industrial countries. Switzerland has few very wealthy or very poor and has therefore considerable middle-class conservatism and individualism even among her working classes. This, coupled with the fact that the federation, the cantons, and municipalities have largely worked on lines of public ownership and operation, is probably the reason why organized political socialism has not found large expression in Switzerland. The *Grütliverein* (organized in 1838 in Geneva) is by far the oldest distinctively labor organization in Switzerland; tho to-day mainly political and connected with the Socialist Party, it was long educational and general. By 1845 it had largely spread through the country. By 1848, however, it had become markedly radical and was suppressed in many cantons, including Bern. It, however, did large preliminary work for socialism. In 1864 a branch of the International was founded in Geneva, and by 1869 thirty-two branches were said to exist in Geneva alone. But the movement did not endure. (See INTERNATIONAL.) It was largely a foreign importation.

Switzerland has long been the asylum of political refugees from other lands. Thus Geneva has been the shelter from which at one time

Socialism

Mazzini tried to rouse a Young Europe, which Bakounin sought to make the center of anarchism, and from whence Russian nihilists have tried to reach Russia. But these movements have little affected Switzerland. Driven from Germany by the anti-Socialist law, many German Socialists found refuge in Basel, and somewhat developed German socialism in Switzerland, yet after all not at all commensurably with the Swiss development of unconscious socialism.

Yet in 1873 a People's Association (*Volksverein*) was formed, and also a Worker's Federation (*Arbeiterbund*), both national and both affiliated with the *Grütliverein*, and in 1877 adopted the program of Marxist socialism. In 1888 the present Swiss Social Democratic Party was formed. In this the *Grütliverein* is now largely merged, its secretary, since 1904, being the secretary of the

party, tho the association still keeps up its organization and celebrates its seventieth anniversary in 1908. The party now claims 20,337 paying members, a number which of recent years has declined rather than grown; it cast some 70,000 votes, and it has at present only two representatives in the *Nationalsrath*, tho it claims to have elected six members, and that four were unjustly unseated through technicalities. In many of the municipal councils of the larger cities the party, however, has numerous representatives. Switzerland, however, has many socialistic features, nationalized telegraph, telephone, postal savings-banks, and railroads (voted in 1898 and now being rapidly accomplished). There is also a federal alcohol monopoly.

The Federation of Switzerland, 1886-87, undertook to restrict and control the distilled liquor traffic. It bought the distilleries and required a fee on importers. The minor distilleries were destroyed, 60 or 70 being left. One tenth of the value of the product is devoted to hospitals for inebriates and other institutions. This tenth in 1902 was 581,859 fr. Most of this was spent on prisons, asylums, and neglected children; only 100,000 on inebriate asylums and temperance work. Swiss authorities differ on the result. Some say a "beer plague" has been substituted for a "whisky plague." The strict abstinence movement is growing, there being 350 societies, with 8,500 members and 5,900 associates.

T

TAFF VALE RAILWAY CASE: A suit brought in England in which the Taff Vale Railway Company was given £23,000 damages against the Amalgamated Society of Railway Servants for persuading and intimidating workmen to break their contracts with the railway, and aiding and abetting acts of violence which together injured the railway company in the amount named. The corporation sued the members of the trade-union individually, and then, under a rule of the court, joined the organization itself. The decision went in favor of the corporation. On appeal it went against the corporation. It was then carried to the highest court in England, the House of Lords, and the latter held that the members of the association individually and the

association itself were liable. The decision created considerable discussion especially in labor circles, where it had been commonly held that trade-unions could not be sued. It has led to constant agitation since in England for a change of law, making the trade-unions not liable with their funds, and it was this decision (see TRADE-UNIONS IN GREAT BRITAIN) which largely led the British trade-unionists into independent political action in the parliamentary elections of 1906.

TAILORING TRADES: The tailoring trade is *par excellence* the trade of the sweat-shop. But for this, see SWEAT-SHOPS. Slowly, however, the trade is being driven from the sweat-shop and organization of the workers is being effected.

The census for 1900 shows a capital of \$169,298,434 invested in the manufacture of clothing, factory product, in the 8,581 establishments reporting for the United States. This does not include the capital stock in the industry. The value of products is returned at \$436,881,648, to produce which involved an outlay of \$16,983,635 for salaries of officials, clerks, etc.; \$78,424,066 for wages; \$49,279,187 for miscellaneous expenses, including rent, taxes, etc.; and \$230,098,018 for materials used, mill supplies, freight, and fuel. It is not to be assumed, however, that the difference between the aggregate of these sums and the value of the products is, in any sense, indicative of the profits in the manufacture of clothing during the census year. The census schedule takes no cognizance of the cost of selling manufactured articles, or of interest on capital invested, or of mercantile losses, or of depreciation.

Statistics

Altho the manufacture of men's clothing as a factory product began in the U. S. prior to 1830, it was not until the census report of 1890 that the statistics for this branch of the clothing industry were given separately.

The number of establishments increased 864, or 17.7 per cent, between 1890 and 1900. In the same period the capital decreased \$7,633,196, or 6 per cent.

The average capital per establishment, which in 1890 was \$26,352, had decreased to \$21,047 in 1900, indicating that the increase in establishments had been in smaller shops. The total number of wage-earners reported in 1900 showed a decrease of 23,976, or 16.5 per cent, and their wages decreased \$5,570,059, or 10.9 per cent. The greatest decrease was in the number of men, with 19,709, with a decrease in their wages of \$5,968,327. This decrease can be explained partly by the substitution of women for men and partly by difficulties in correctly ascertaining the number of workers.

The average number of women wage-earners decreased 5,759, or 7.6 per cent, but the total wages paid to women increased \$131,649, or $\frac{1}{5}$ of 1 per cent. The number of children under sixteen years of age increased 1,492, or 98.2 per cent, and the wages paid them increased \$266,619, or 179.3 per cent.

The census of 1860 was the first in which the manufacture of women's clothing was reported. With the exception of the abnormal increase in the number of establishments in 1870 and the consequent decrease in 1880, there was a very steady increase during every decade. With but few exceptions the figures for every item more than doubled each decade. In 1860 the number of establishments was 188, and in 1900, 2,701, an increase of more than thirteenfold; during the same period the capital increased \$47,009,894, or more than thirty-threefold; the number of wage-earners, 78,000, more than thirteenfold; the total wages paid, \$31,393,069, or more than twenty-sixfold; the cost of materials used, \$81,381,257, or more than twenty-fourfold; and the value of products, \$152,158,500, or more than twenty-onefold.

As the manufacture of women's ready-made clothing is not distributed over as many places as is that of men's, and as a large part of it is manufactured in large factories and in shops, the collection of statistics could be more accurately done, and the figures may be taken as more approximately correct.

In contrast with the manufacture of men's clothing, this branch of the industry showed a large increase in the number of wage-earners and of the wages paid. The total number increased from 39,149 to 83,739, and the total wages from \$15,428,272 to \$32,586,101. The development of the industry during the decade was of such a nature that men were substituted for women in the manufacture of certain of the better grades of clothing, such as cloaks and ladies' suits, while the greatest number of women were added in the factories for shirt-waists and underwear.

Tailoring trades were among the first to organize labor-unions in the U. S. A tailors' organization existed in New York City in 1806. The Knights of Labor (*q. v.*) began among the Philadelphia tailors. Cutters' unions have existed in New York City since the forties. Nevertheless, the trade has, as a whole, because of the large proportions of people involved in the sweating system, been one of the most difficult to organize. Organizations innumerable, local and general, have come and gone. The United Garment Workers, organized in 1891, has been undoubtedly the most successful general organization, and has at times attained large proportions. It adopted a union label in 1891 which has had considerable success. (See UNION LABELS.) Some 2,000,000 labels were said to have been issued during 1898, and in 1900 ninety firms were using the label. The organization has at times been one of the most active of the unions affili-

ated to the American Federation of Labor, but has had several ups and downs on account of the difficulty of the conditions in the trade. A large number of its members are foreigners, working in the great cities and exposed to severe competition from different employers on the one hand and unorganized working people on the other. In 1903 they claimed 45,700 members. In 1905 the number was reduced to 31,900. (See article SWEAT-SHOPS.)

The Journeymen Tailors' Union of America, organized in 1883, had in 1905 16,000 members composed of the more skilled members of the trade. In Great Britain conditions are virtually the same. Some of the earliest trade-unions of modern times existed among London tailors. The Amalgamated Society of Tailors dates from 1866, while national unions were formed earlier. Yet here, as in America, permanent and effective organization has been very difficult to reach. The Amalgamated Association had in 1904, 12,964 members, the Scottish Operative Tailors and Tailoresses, 3,551. (See SWEAT-SHOPS.)

TAMMANY HALL: This powerful, compact political organization, which, with rare intermissions, has ruled New York City from the year 1800 and which has exercised a great influence at times in state and national affairs, is an outgrowth of the Society of St. Tammany, a Columbian order. Founded on May 12, 1789, a fortnight later than the establishment of the national government, the society of St. Tammany was the creation of William Mooney, an upholsterer. Before the Revolution, societies variously known as the "Sons of Liberty" and the "Sons of St. Tammany" had been formed to aid the cause of independence. Tammany, or Tammanend, was an Indian chief noted for his wisdom, benevolence, and love of liberty. When societies sprang up bearing the names of St. George, St. Andrew, or St. David, and proclaiming their fealty to King George, the revolutionists dubbed Tammany a saint in ridicule of the imported saints. After the Revolution these patriotic societies dissolved.

The passionate controversy over the adoption of the Constitution caused Mooney to found anew a Tammany society. His object was to create a society, democratic in character and principle, which would resist centralizing power in the national government. At first non-partizan, the society by 1798 became a powerful and extremely partizan body, warmly supporting Jefferson and his doctrines. Aaron Burr realized the power that it could be made; the transition of the society from an effusive, speech-making body to an active political club was mainly through his instrumentality. Burr controlled Tammany until his downfall, after his duel with Alexander Hamilton in 1804.

In 1805 the Tammany Hall political organization as apparently distinct from the Tammany Society was created. In that year the society obtained from the legislature a charter incorporating it as a benevolent and charitable body for the purpose of affording relief to members and others. This change was made to meet the bitter criticisms that a private society was engaging in politics. As a matter of fact the sachems of the society were the leaders of the organization, or their henchmen, and this has been the case ever since. The secret of the power of the control of the society has been in the fact that the society has been the owner of Tammany Hall, and, in the

capacity of landlord of the building, has had, and still has, the power of dispossessing any faction hostile to the bosses of the political organization. Evicted from Tammany Hall, the contesting faction could not lay claim to being the Tammany organization or any part of it. This happened in 1828, when the sachems, as trustees, excluded a faction working for the nomination for president of John Quincy Adams from meeting in Tammany Hall, which was a fatal disadvantage in politics. It happened again in 1853 when a faction opposed to the leaders of the organization was prohibited by the sachems from meeting in the building. The same process was used by the sachems in 1857, and later during the Tweed régime.

Before 1806 Tammany was more of a political club without any systematic regimentation. In that year a disciplined organization was formed. A general committee was created which should have the power of convening all political meetings of the party and of making preparatory arrangements for approaching elections. This committee, then composed of thirty members, has gradually been expanded until now it numbers more than five thousand members. Nominating, corresponding, and ward committees were also created. In a few years Tammany had a powerful political machine, unequaled anywhere in the world. It moved with clock-work precision. Its intense opposition to government by aristocracy gave it increasing political strength. Soon its influence in local, state, and national elections was very great. This influence and strength increased after

History

1821 when manhood suffrage was enacted in New York State, and was still more increased by Tammany's support and organization of immigrants who poured in heavily, especially from 1846 onward. While the Whigs antagonized the foreign influx, Tammany took it in hand, saw to its naturalization, and gave it material support by providing jobs and offices for the chief political workers among the foreign-born citizens.

Up to 1840 Tammany was led by bankers and merchants who generally used their political power for corrupt self-advancement or who became enriched by granting, for bribes, special privileges of various kinds. Nearly all the leaders from Mooney down had been guilty of some crime, ranging from embezzlement to corruption in passing laws for capitalistic interests, then in a nascent state. Law after law was passed granting bank charters, railroad franchises, and other privileges which, the evidence showed, were obtained by bribery. The most notorious of Tammany's clique of leaders was Samuel Swartwout, who was a great power in the organization about 1825-37 and who, as Collector of the Port of New York, embezzled \$1,222,705.69 from the government.

From 1840 Tammany began to be ruled from the bottom of the social stratum, instead of from the top. The rough element, backed by their stronger political and fistic power, came up from the slums and assumed control. Under the leadership of Fernando Wood, the criminal and boisterous element was marshaled systematically in the Tammany organization. Before that time there had been incessant frauds at the polls, but they were insignificant compared to those from 1840 on. Corruption was more brazen. When previously Tammany had been directly and

clandestinely used by capitalists to get special privileges worth incalculable sums for nothing, it now was used indirectly. With the enormous bribes that they received the leaders now assured themselves a large, mercenary following which packed primaries and repeated at the polls, as ordered.

Until 1867 the Tammany organization was held in the control of cliques of constantly changing leaders. Wood had been the nearest approach to a boss. With the control of Tammany by William M. Tweed the boss system was developed to its highest pitch. Tweed absolutely ruled the organization. He and his accomplices plundered the city of more than \$100,000,000 from 1867 to 1872. At the same time they made

Tweed a regular traffic of selling special privileges to the highest bidder.

Some of the richest families in America, the Vanderbilts and Goulds for instance, owe the greater part of their wealth to exploitative laws passed during the Tweed régime. Tweed not only controlled the whole municipal government, but the legislature, of which he was a member, as well. A political uprising of the people resulted. Tweed was indicted and imprisoned. After serving a year he was released, but was immediately rearrested on civil charges and held in \$3,000,000 bail. Not being able to get this he was remanded to jail, where he lingered until his death in 1878. In 1872 he was succeeded as boss by John Kelly. Tammany was a byword the world over, but Kelly showed that sagacity which Tammany leaders had almost invariably shown in critical times. By persuading a number of prominent "reform" Democrats to enter the organization, and because of his plea that the corruptionists had been cast out, the organization was able to weather the storm. At basis, however, it was as corrupt as ever. Upon Kelly's death in 1886, Richard Croker became boss, and he, in turn, was succeeded by the present boss, Charles F. Murphy, in 1902.

GUSTAVUS MYERS.

TARIFF (see FREE TRADE; PROTECTION): In this article, for convenience of reference, we merely trace the outline of the United States tariff, leaving its principles to be discussed under the above-mentioned heads.

The Congress of 1789 imposed a tariff duty of from 5 to 15 per cent, almost exclusively a tariff for revenue only. From 1802-12 the ad valorem duty on dutiable and free articles averaged 19.36 per cent, ranging from 23.40 per cent in 1804 to 17.88 in 1810. The War of 1812 doubled duties from 1813-15, the rates averaging 33.03 per cent. With the act of 1816 the protective principle first appears prominent, the rates averaging from 1816-20, 22.53 per cent. From this time on to 1832 the protective principle was more and more adopted in successive acts, as those of 1824 and 1828. From 1821-26 the rate averaged 33.07 per cent, and from 1827-1831, 40.21. In 1832 a reduction was made to remove the "abominations" of the act of 1828. In 1832 the rate averaged 30.86, and in 1833, 23.95 per cent. The growing influence of the South obtained still further reductions, and from 1834-43 the average was 17.18 per cent, ranging from 20.84 in 1838 to 15.45 in 1840. In 1842, however, protectionist measures slightly

prevailed, yet from 1844-57 there was a steady tendency to enact lower rates, and the average during this period was 23.85. In 1857 still further reductions obtained, and the average from 1857-61 was 16.35, falling in 1861 to 14.21 per cent. In 1861, however, the Morrell tariff act was passed, followed by still further enactment of "war tariffs," the average from 1862-65 being 31.21, rising from 26.09 to 38.46. After the war still higher protective rates prevailed, rising from 41.81 in 1866 to 46.49 in 1871, and averaging during this period 43.95. From 1871-91, under the dominance of the Republican Party in Congress, the rate averaged 29.70 per cent, ranging from 38.94 in 1871 to 25.25 in 1891. In 1882 a tariff commission was appointed, resulting in little change. In 1890 the celebrated McKinley Act was passed by the protectionists. In 1894, under a Democratic administration, the Wilson Act was passed, yet it so slightly reduced the tariff, that President Cleveland, weakly allowing it to become a law, tried to avoid responsibility for it by declining to sign it. The only important change from the McKinley Act was the admission of wool as free, while to please the Sugar Trust, a duty of 40 per cent was placed on sugar and an additional duty on refined sugar. The ratio from 1890-96 inclusive averaged for the respective years 29.12, 25.25, 21.26, 23.49, 20.25, 20.67. All these rates, however, it must be remembered, were the percentages on dutiable and free articles. On dutiable articles alone the corresponding rates for the last seven years have been 44.41, 46.28, 48.71, 49.58, 50.06, 41.75, 40.18.

In 1896 the Republican Party was returned to power with McKinley as president. His election was naturally construed as an indorsement of protection, altho the real issue in the campaign had been the free-silver question. A special session of Congress, March, 1897, passed, after a prolonged debate, the Dingley Act, which was closely modeled after the McKinley Act. The duties on a few articles, e. g., wool and woolen goods, cutlery, pottery, etc., were made even higher than in the McKinley Act of 1890. Some articles, e. g., lumber and hides, were restored to the dutiable list. The War Revenue Law of June 13, 1898, was more in the nature of an internal-revenue measure, and imposed no additional tariff duties except ten cents on a pound of tea. The law was repealed April 12, 1902.

Nearly all civilized countries have protective tariffs, e. g., France, Germany, Russia, and the other Continental countries; Japan, Canada, Australia, Cape Colony, etc. The example of England as a free-trading country has been followed only by a few of her dependencies, e. g., India. The tendency toward reciprocity and preferential tariffs is spreading. During the last few years Mr. Joseph Chamberlain has been advocating a protective duty for Great Britain, but without any tangible results.

TARIFF REFORM IN GREAT BRITAIN:

The movement, now in progress in Great Britain, in favor of a reform of the fiscal policy introduced by Cobden sixty years ago, had long been foreseen as inevitable by attentive observers of economic and political developments both within and without the British Empire. The Fair Trade movement in the early "eighties," and successive resolutions passed by one colonial conference after another, clearly indicated the growing conviction that a fiscal policy inaugurated two generations

ago, under totally different circumstances from those now prevailing, and on the strength of hopes and prophecies every one of which had been falsified by events, was no longer suited either to the needs of the United Kingdom or those of her great and growing empire beyond the seas. At the last of these colonial conferences, held in London in the summer of 1902, a strongly worded resolution was unanimously passed by the imperial statesmen taking part in it, repeating the declarations of previous conferences in favor of a system of mutual preferential trading between the mother country and her daughter states, and binding the signatories "to submit to their respective governments at the earliest opportunity the principle of the resolution, and to request them to take such measures as may be necessary to give effect to it."

Upon Mr. Chamberlain, then colonial secretary, as representing the mother country on this occasion, thus devolved the duty of submitting, "at the earliest opportunity," this definite offer of preferential trading relations to the government, and therefore, ultimately, to the people of Great Britain. He lost no time in doing so. Immediately upon the publication of the proceedings at the conference, in November of the same year, he laid before the cabinet proposals for a policy of colonial preference in connection with the then existing 1s. duty on corn. Strong opposition was offered, however, to this proposal by Mr. Ritchie, then Chancellor of the Exchequer, and after considerable discussion in the cabinet, the proposal was dropped.

In March, 1903, Mr. Ritchie introduced his budget providing for the repeal of the 1s. duty on corn. Nothing daunted, Mr. Chamberlain at once decided on his course of action, and in an epoch-making speech

Beginnings

at Birmingham, on May 15, 1903, he for the first time put before the country the policy of preferential tariffs as being, in his opinion, the most important means of promoting the unity and prosperity of the British Empire. A fortnight later, on May 28th, during a debate in the House of Commons on a motion for adjournment made by Sir Charles Dilke, in order to raise the subject of fiscal policy, Mr. Chamberlain dealt still more explicitly with the question, and received on that occasion the sympathetic support of the Prime Minister, Mr. Balfour.

Meanwhile the keenest interest in the new policy had been aroused throughout Great Britain and the empire; and while it became more and more evident that the cabinet was divided in opinion on the matter, it was none the less clear that the future of the policy would have to be decided outside the walls of the House of Commons, by an appeal to the British electorate. In these circumstances the government decided that there should be an official inquiry, "a most careful examination of every side of the problem," as Mr. Balfour put it in the House of Commons (June 10, 1903), and that the results of this inquiry should be published by the Board of Trade as material upon which it might be possible to come to a decision on the merits of the new proposals. At the same time Mr. Balfour adhered to his declaration of May 28th, that the whole matter lay outside the province of the existing House of Commons, that the question could not be dealt with that session or the next, or the session after that, but would have to

be most carefully examined and exhaustively thought out. On these terms all further development of the situation in Parliament was checked for the time being.

The movement, however, proceeded apace in the country. Two powerful organizations had been formed during the summer for the propagation of Mr. Chamberlain's policy; one—the Imperial Tariff Committee—operating in Birmingham and district, the other—the Tariff Reform League—embracing in its scope the whole of the rest of the United Kingdom, with headquarters in London, and branches in all parts of the country. At the same time the political opponents of Mr. Chamberlain were not idle, and institutions of a similar nature were organized on behalf of so-called "free trade." The Cobden Club received a fresh lease of life, and its efforts were seconded by those of a new organization entitled the "Free Trade Union." More significant still as a sign of the disintegrating effect of the situation on old party distinctions, was the banding together of a small body of Unionist members of Parliament under the somewhat fantastic, not to say meaningless, title of the "Unionist Free Food League." All these organizations, together with various less important bodies, have since been busily engaged in flooding the country with propagandist literature in the shape of leaflets and pamphlets, and in organizing meetings upon one side or the other in the towns and villages of the United Kingdom.

The results of the official fiscal inquiry instituted by the government were published by the Board of Trade in Sept., 1903, in the shape of a bulky volume of statistical memoranda and charts. The facts and figures thus made public were claimed as proving their respective theories by partisans of both sides in the controversy, but the general result of this inquiry, while not conclusive, was nevertheless distinctly favorable to the views of tariff reformers, who did not fail to take all possible advantage of the fact.

The close of the Board of Trade inquiry brought with it the open rupture in the cabinet which had been, from the first, inevitable. On Sept. 18th the country was startled by the announcement of the resignations of Mr. Chamberlain, Mr. Ritchie, the Chancellor of the Exchequer, and Lord George Hamilton, the Secretary of State for India. The resignation of Lord Balfour, Secretary for Scotland, followed within a few days. But tho all these ministers resigned, their action was dictated by very different reasons. Mr. Ritchie, Lord George Hamilton, and Lord Balfour were pronounced Cobdenites of the straitest sect. They resigned as the strongest protest they could offer against any change, however small, in that free importing policy which they had come to regard as equivalent, if not superior, to the free trade preached by Cobden. Mr. Chamberlain, on the other hand, left the cabinet, as the only course which would at once set him free to devote himself unreservedly to the advocacy of the preferential policy he had at heart, while at the same time leaving Mr. Balfour unembarrassed in his leadership of the Unionist Party on the more popular part of the tariff-reform program, that officially known as the policy of "retaliation," or retaliatory duties on foreign manufactured goods.

On Oct. 1, 1903, Mr. Balfour spoke at Sheffield on the occasion of the annual meeting of the National Union of Conservative Associations.

He declared that while he was opposed to the taxation of food, it was not as a matter of principle but because it was not then practical politics. He did not think public opinion was ripe for it. But he was in favor of the policy known

as retaliation. "Tariff attacks," he said, "could only be met by tariff replies." He stated that he desired "to reverse the fiscal tradition which has prevailed during the last two generations" by asking the people of Great Britain "to reverse, to annul, and delete altogether from the maxims of public conduct the doctrine that you must never put on taxation except for revenue purposes. . . . This country should again have what every other country in the world possesses, and that of which no other country in the world would think of depriving itself, the liberty to negotiate and something to negotiate with." The policy enunciated in this speech is commonly referred to by fiscal controversialists as the "Sheffield program." It was unanimously indorsed by the National Union of Conservative Associations in a resolution passed to that effect.

On Oct. 6, 1903, Mr. Chamberlain opened his first fiscal campaign with a great speech at Glasgow, in which he laid before the country what he described as "a sketch plan" of his fiscal proposals. These may be succinctly stated as follows:

PROPOSED NEW TAXES

- 2s. a quarter on foreign (not colonial) corn.
- Corresponding tax on foreign flour.
- Five per cent on foreign meat.
- Five per cent on foreign dairy produce.
- An average 10 per cent on completely manufactured foreign goods.

TAXES TO BE RELIEVED

- Three quarters of the existing duty off tea.
- Half the existing sugar duty taken off.
- Corresponding reduction on coffee and cocoa.
- Preference to colonial wines and fruit.

DUTIES NOT CONTEMPLATED

- No tax on raw materials.
- No tax on maize.

In the same speech Mr. Chamberlain stated that he had worked out the probable effect of these proposals upon the cost of living in the United Kingdom and considered that they would result in a gain of about 2d. a week in the case of the agricultural laborer and 2½d. a week in the case of the town artisan. "Nothing I propose," he declared, "will add one farthing to the cost of living of the workingman or of any family in this country."

The Glasgow speech was quickly followed by others, delivered at Greenock, Newcastle, Birmingham, Cardiff, Newport, Leeds, Liverpool, London, and other towns and cities, speeches in which Mr. Chamberlain dwelt in detail on the various aspects of his policy, answering the objections raised by his opponents, and appealing both to the local experience of his auditors and their national and imperial patriotism.

But the energies of Mr. Chamberlain and his lieutenants were not confined to the making of speeches. The necessarily inadequate results of the inquiry undertaken by the Board of Trade into the condition of the trade of the country had shown the need of some wider and more searching investigation of the many difficult problems involved. On Dec. 16, 1903, Mr. Chamberlain stated in a speech at Leeds that a tariff commission, composed of trade experts and influential business men, had been formed to undertake this

task, and two days later the nature and scope of its work were announced together with the names of the commissioners and secretary. The commission, at time of writing, still carries on its work, the value of which is best attested by the series of elaborate reports already issued, dealing with the iron and steel, cotton, woolen, hosiery, lace, carpet, silk, flax, hemp, and jute industries.

The year 1904 was marked by little of importance in the way of parliamentary developments. But the war of leaflets and of platform discussion went on with, if possible, increased vigor, and public interest in the controversy

Campaign

showed no signs of flagging. On Jan. 11th came the publication of letters which had passed between the Duke of Devonshire and Mr. Chamberlain relative to the position of the Liberal Unionist Association, of which the duke was president, in regard to the fiscal question. This correspondence was quickly followed by a split in the organization, and ultimately by the reconstitution of the Liberal Unionist Council, on the basis of a fuller popular representation of the party, under the presidency of Mr. Chamberlain.

As the parliamentary session wore on efforts were made by the Liberal Opposition to embarrass both the government and Mr. Chamberlain by means of adroitly drawn resolutions on the subject of fiscal policy, all of which proved abortive. It became increasingly evident that the working agreement between the Prime Minister and Mr. Chamberlain was not to be shaken by any maneuvers on the part of their opponents. The reality of the sympathetic alliance between them received additional confirmation on Oct. 3, 1904, when Mr. Balfour, in a speech at Edinburgh, accepted Mr. Chamberlain's suggestion that the whole question of preferential tariffs should be submitted to the consideration of a colonial conference, specially called together for that purpose, and adopted it as the policy of the government. This fresh advance on the Prime Minister's part was warmly welcomed a few days later by Mr. Chamberlain in a speech at Luton.

Throughout the session of 1905 the parliamentary situation remained very much what it was in the previous year, and the same may be said of the progress of the movement in the constituencies. The chief event of importance during the year was, perhaps, Mr. Balfour's restatement of his position in a speech delivered at the Albert Hall on June 3d, and again, in the House of Commons, on June 7th. It did not, however, either add to or subtract from his previous pronouncements on the fiscal question. "Honorable gentlemen opposite," he said to the House of Commons, "talk as if it was in the Albert Hall that I for the first time said that this question of fiscal reform stood in the forefront of our constructive policy. It must be quite obvious that this is so; and I have said so on all occasions. It is equally obvious, and I have equally said so, that of all the branches of fiscal reform that which was connected with the problem of drawing closer the commercial bonds between us and our colonies was the most important part of our policy."

The manner in which this declaration was received by Mr. Balfour's followers was made clear at the annual meeting of the National Union of Conservative Associations at Newcastle on Nov. 14, 1905, when a resolution was carried by a practically unanimous vote strongly approving of

the program outlined by Mr. Chamberlain. When, late in 1905, Mr. Balfour's government resigned office, it was on the twofold policy of retaliation and preference that the Unionist Party went to the country.

The result of the general elections of 1906 is still fresh in the public mind, but it is safe to say that no one in Great Britain, on either side of politics, now regards the sweeping victory gained by the Liberal and Labor Party as representing the conclusive verdict of the British electorate on the fiscal issue. That issue was obscured by, and to a large extent subordinated to, a variety of other issues more or less completely alien to it, as, for example, the education question and that of Chinese labor in the Transvaal. An analysis of the electoral results and their causes would be instructive on this point, but demands more space than we can give to it. It must suffice to remark that the huge Liberal and Labor majority in the present House of Commons affords no indication of the real strength of the Liberal and Labor vote in the constituencies, since out of a total of 5,358,000 votes cast at the general election no less than 2,350,000, or 44 per cent, were given for Unionist candidates. In other words, if we leave out of consideration all the questions—home rule, education, Chinese labor, and other issues—which undoubtedly influenced the Liberal and Labor majority, the most that can possibly be claimed for Cobdenism is a poll of little more than one half the total electorate. And this within three years of the opening of the fiscal campaign, and at the first appeal to a people notorious for conservatism.

The present position of the Unionist Party in regard to the fiscal question is clearly defined in the following correspondence, which appeared in the press of Feb. 15, 1906:

4, CARLTON GARDENS, S. W.,

Feb. 14, 1906.

MY DEAR CHAMBERLAIN: The controversy aroused by the fiscal question has produced, not unnaturally, an impression, which I have constantly combated, that the practical differences between fiscal reformers are much deeper than is in fact the case. The exchange of views which has recently taken place between us leads me to hope that this misconception may be removed, and with it much friction which has proved injurious to the party. My own opinion, which, I believe, is shared by the great majority of the Unionist Party, may be briefly summarized as follows:

I hold that fiscal reform is, and must remain, the first constructive work of the Unionist Party.

That the objects of such reform are to secure more equal terms of competition for British trade and closer commercial union with the colonies.

That, while it is at present unnecessary to prescribe the exact methods by which those objects are to be attained, and inexpedient to permit differences of opinion as to these methods to divide the party, the other means may be possible, the establishment of a moderate general tariff on manufactured goods, not imposed for the purpose of raising prices or giving artificial protection against legitimate competition, and the imposition of a small duty on foreign corn, are not in principle objectionable, and should be adopted if shown to be necessary for the attainment of the ends in view or for purposes of revenue.

Believe me, yours sincerely,

ARTHUR JAMES BALFOUR.

40, PRINCE'S GARDENS, S. W.,

Feb. 14, 1906.

MY DEAR BALFOUR: I cordially welcome your letter of today, in which you have summarized the conclusions that we have reached during our recent discussion. I entirely agree with your description of the objects which we both have in view, and gladly accept the policy which you indicate as the wise and desirable one for the Unionist Party to adopt.

In endeavoring to give effect to this policy, and in defending all Unionist principles, any services that I can render will be entirely at your disposal.

I am, yours very truly,

J. CHAMBERLAIN.

TAUSSIG, FRANK WILLIAM: Was born in St. Louis, Mo., in 1859. He received from Harvard University the degrees of A.B. in 1879, Ph.D. in 1883, LL.B. in 1886. He studied in Europe one year, and has since been professor of political economy in Harvard University. His main works are: "Tariff History of the United States" (1879-1898, 6th ed., 1899); "The Silver Situation in the United States" (1892); "Wages and Capital" (1896); and various contributions to the *Quarterly Journal of Economics*. Address: Harvard University, Cambridge, Mass.

TAYLOR, JOHN WILKINSON: Member British Parliament of the Independent Labor Party for Chester Le Street, Durham; born 1855 in Durham; newspaper boy at nine; apprenticed to blacksmith at twelve, he worked at the trade for forty years; and is now in business with his brother as a printer. He is a justice of the peace, a county councilor, and member of the education committee; a staunch member of the Independent Labor Party, and chairman of the Annfield Plain Cooperative Society, which has a membership of 6,000. In 1906 he was elected to Parliament chiefly by the Durham Colliery Mechanics' Association, and other working men of his district. Address: Dipton, S. O., County Durham, England.

TAXATION: We cover in this article a definition of taxation: I. History of Taxation; II. Forms and Methods of Taxation; III. Taxation in the United States. IV. The Theory of Taxation; V. Tax Reform; VI. Separation of State from Local Taxation.

In the broadest sense an exercise of the taxing power of the State occurs whenever any compulsory contribution is taken from any person, private or corporate, under the authority of the public powers. But such a broad definition would include also a number of charges which are not taxes in the narrower or strict sense. It would include, for example, certain fees and other special charges for special services. In the narrower sense a tax is a compulsory contribution levied to defray the expenses incurred in conferring some common benefit, in which all persons subject to the tax have a right to participate and for which the government makes no specific counter-service. When a distinct or specific service is rendered by the government in return for the contribution by the individual the payment may be: a fee, if it does not equal or exceed the cost of the service rendered; or a price, if it exceeds or equals the cost of the service rendered.

I. History

Taxation in the sense above defined is of comparatively recent development. In the earliest stages of economic life, when a condition of savagery prevails, there are no taxes in the above sense, nor, in fact, any public revenues proper, inasmuch as there is no government and such authority as is exercised by chiefs or leaders has a distinctly private rather than a public purpose. In the stages of economic life immediately above savagery, where government authority is exercised by the head of the clan or family or by a council of such heads who are themselves in control of all the wealth of the family, there is still no recognition of public, as distinct from private, revenues, and there can be no taxes proper.

In early times and, to an extent, all through classic times, taxation was light. Ancient States received their main revenues from wars, the conduct of State colonies, and trading expeditions, the management of State mines, forests, lands, etc. Slaves did the most of the labor, and foreigners were compelled to pay for protection in money or heavy tribute. Officials were paid usually not by salaries but by fees, and hence were of small expense to the State. Boeckh (bk. iii., i.) divides the revenues of Athens into "duties arising partly from public domains, including the mines; partly from customs and excise, and some taxes upon industry and persons, which only extended to the aliens and slaves; fines, together with justice fees and the proceeds of confiscated property; tributes of the allied or subject States, and regular liturgies" (or payments for amusements for the people, etc., by the holders of the offices). Grote puts the annual expenditure of Athens in the age of Pericles at 1,000 talents, which Professor Ely ("Taxation in American States and Cities," p. 25) values at \$1,200,000.

Rome passed from a period of light taxes to a period of 120 years (163-43 B.C.), when successful wars relieved her from necessity for any taxes, and then to a period of heavy and increasing taxation. Cicero, in his "De Officiis" (45 B.C.), speaks of taxation as a thing to be avoided if possible, and adopted only in extreme necessity. In Japan and most Asiatic and despotic countries taxation consisted of a tax paid in service to the State and in tithes laid on the land, and in most countries farmed out, as in the later Roman Empire, to corrupt and merciless tithe collectors, as in Turkey to-day.

In the Middle Ages the concept of the State was that it belonged to the prince or sovereign. Public employees were private servants. Large domains were set apart for the support of the sovereign. The kings at first collected no taxes from the peasantry; the king, under the general feudal conception, was supposed to own all the land, and not to part from this ownership. But he subdivided it among his barons to rule over (not to own), and for that right they did homage—i. e., paid service to the king, usually by bringing to the king a contingent of troops in time of war. They in turn subdivided their lands among the lower gentry or knights, again only to rule over, not to own, and for this obtained homage or service from the knights. These finally gave to their serfs the land to live on and cultivate (not own), and for this received from the serfs a certain amount of service. In this way there were practically no taxes, but each paid to his feudal superior a certain amount of service; the other expenses of the king and greater barons being met out of conquest, or lands held directly as theirs to use. Such was the general feudal conception, modified, however, in a thousand ways by various local conditions, concessions, customs, and traditions. At a later period, however, especially when the countries grew more settled, the barons often preferred to stay and defend their own lands or carry on their own wars, and so, instead of giving contingents of troops to the king, gave a commutation or money substitute. The kings preferred this, as it enabled them to hire standing mercenaries, and be more independent of their barons. This money payment became a tax. The next step was, as the necessities of the king grew, to extend taxation to all classes. It was overlooked or ignored that the other classes were already paying their service to the barons, for him to pay to the king. The lower classes began to be compelled to pay their feudal superiors and the king also. Gradually then the barons began to claim the ownership of the land in fee simple, instead of in use for the king, and what they were paid in service, and later in money, they kept as rent, and what the king collected was tax. (See LAND.)

The first taxes to emerge from the darkness of this period were a number of contributions of the nature of commuted feudal services or such as arose directly from feudal rights. There were also certain market dues, customs duties, tolls for the use of roads, bridges, and ferries, and two forms of the property tax—land taxes and family taxes. The land taxes, as has been suggested above, are just emerging from the character of rent payments and are only by degrees acquiring the character of pure taxes, but the combination of those charges with the hearth or family tax led to the formation of the mixed property and personal tax.

Direct taxes in this period, as in classical times, are never paid by the freeman as they are considered derogatory and are the badge of a servile position. The freeman might give his services to the State, might risk his life for it, but would regard it as an insult to have to pay taxes. Hence when necessity came to ask even the freemen to contribute to some common cause, as the

Turkish wars, these contributions were given a name, such as "donation," "bedes" (from the German *beden*, to beg), and the like, which indicated their voluntary character, and only after these voluntary contributions had been so repeatedly called for that their payment became customary was it possible to introduce any element of compulsion. Indirectly, of course, freemen were taxed, as for example when they bought merchandise for permission to sell which the trader had been taxed. As soon, however, as industry began to develop, as soon as the crafts sprang up in the cities which clustered around the market-places, and a considerable body of the citizens came to live entirely from industry, there arose such differentiation of sources of wealth that the old forms of taxation were insufficient and new forms suited to the new conditions were devised. It was in the cities which retained a large degree of political independence that the highest development of taxation took place in the Middle Ages.

The history of modern taxation is the history of the recognition and control of taxation by legislation. The earliest parliaments were called to vote taxes. The recognition of the principle of "no taxation without representation" is the development of representative government. English constitutionalism has been built on the granting of taxes. According to the Magna Charta, "No scutage (land tax, or commutation for feudal service) or aid shall be imposed on our realm save by the common council of our realm." John was allowed to reserve for himself only the three customary feudal

Modern Taxation

"aids"—contributions in case of king's captivity, on the knighthood of the eldest son, and on the marriage of the eldest daughter. The financial needs of the sovereign compelled in 1294 the addition to the charter, called the statute, "*de tallagio non concedendo*," whereby it was agreed that no taxes should be levied by the king, save with the consent of knights, burgesses, and citizens in Parliament assembled. This, says Green, "completed the fabric of our representative constitution." Parliament has since then been necessary. The Declaration of Rights (1689) declared that "levying money for or to the use of the crown, by pretense of prerogative, without grant of Parliament for longer time or in other manner than the same is or shall be granted, is illegal." This was followed by annual grants of supplies, instead of life grants as before, and annual renewals of the Mutiny Act, containing provisions for the pay and discipline of the army. Annual parliaments have since been necessary. Green calls this "the greatest constitutional change which our history has witnessed" ("Short History of the English People," chap. ix.). That it was the violation of the principle of no taxation without representation which led to the American Revolution is well known.

Taxation in Great Britain to-day is of many kinds. Tho known as a free-trade country (see FREE TRADE), millions of pounds of revenue are still raised from customs duties on wine, spirits, tobacco, and a few other articles. These are not protective duties, however, because a duty is also laid on the home produce, as of spirits. More income is raised from excise duties (see EXCISE), considerable income is raised from stamp and death duties, a growing

proportion from an income tax, while a comparatively small amount of national taxation comes from a land tax. Local expenditures are mainly met by rates on house values.

On the Continent, speaking generally, local expenses are largely met by indirect taxes, such as the *octroi* or duties on commodities brought into a city for sale, national taxation being either direct or from a protective tariff. (See PROTECTION.) In Europe generally various stamp duties are more common than in the U. S. See also the separate countries for their sources of revenue in more detail.

II. Forms and Methods of Taxation

Taxes are commonly grouped as direct or indirect according as it is the intention of those levying the tax that the burden shall be borne by him who pays it or shifted to some one else. While there is more or less difference of opinion among different writers as to where the line should be drawn between the two, yet this distinction is for the most part sufficiently clear. Among the taxes ordinarily considered direct taxes are poll taxes, income taxes, land taxes, taxes on general property, including realty and personalty and various modifications and combinations of these. Among those commonly regarded as indirect taxes are customs duties, excises or, as they are called in the U. S., internal revenue duties, tolls, and certain licenses. Not so definitely belonging to either class are certain taxes like inheritance taxes levied on certain property or wealth regardless of its ownership.

III. Taxation in the United States

In the earlier days of the American colonies there was small need for taxes. England asked no assistance. Quit-rents satisfied the proprietors or the companies, who in turn gave partial protection; there were few officials and few public expenses. Wars had not developed. Forfeitures, fees, fines, and payments for land met all expenses. Land was usually granted for the support of schools. From 1647-89 all the taxes of Rhode Island were about £600 sterling. Fines were collected on the violation of sumptuary laws. Mary Stebbins, in Springfield, Mass., was fined 10s. in 1667 for wearing silks contrary to law, and Nathaniel Ely, in 1674, for selling beer not made according to law. A poll tax was levied at various times by almost all the colonies. In Virginia it was long the only tax. Maryland had, before the Revolution, no other direct tax. Quit-rents were annual charges on land in the colonies under proprietary government. Lands in colonies not proprietary were divided among the members of the colonizing companies according to the amount of stock held or for services rendered. In later settlements the apportionment was according to one's ratable property. Public officials were mainly supported by fees—ministers by christening, churching, and burying fees; clerks by fees for issuing court papers and making records; sheriffs by fees for making arrests and inflicting punishments, etc. Licenses and fines, for sale of liquors, for marriages, for lawyers and peddlers, brought in considerable revenues. Lotteries (q. v.) were common in the later days when expenses grew. Fines were placed—e. g., in Virginia—on widows, in Maryland on bachelors over twenty-five, in New York on wigs. Excise duties were laid in almost all if not all the colonies on the manufacture of liquor. Duties on exports and imports were irregularly laid. Tonnage duties were levied payable in powder and shot. The methods of collection of the most of the taxes were the same as later on. Largesses were common, as in 1644 New Haven began annual contributions for the support of poor scholars at Harvard College. It consisted of a peck of wheat or value of the same from all "whose heart is willing." In Maryland in 1650 an "equal assessment" was made on all those who would not contribute for the maimed, lame, and blind. Private citizens gave often to the state. In Philadelphia, the charter of 1701 gave no power to levy taxes. The act of 1712 established the right of the citizens to control taxation. The State of Pennsylvania did not levy the first direct tax till 1785. It was an annual tax of \$76,945. The annual expenditure of the state government was given by Mr. Wolcott, Secretary of the Treasury, at \$130,000. Taxation was a very grudgingly recognised right. The attempt

Colonial Period

Great Britain

of England to tax caused the Revolution. What state taxes there were were varied. In 1795 Mr. Oliver Wolcott, Secretary of the Treasury, in reporting to Congress a plan for laying and collecting federal revenues, declared that the systems of taxation in the various states were "utterly discordant and irreconcilable in their original principles." Seven states had a uniform capitation tax. All except Delaware taxed land, but in some according to quantity, in others quality. Responsibility in some states attached to the state; in others to the counties or townships. The average annual expenditure of each of the fifteen states was less than \$70,000, the total about \$1,000,000. The New England states taxed live stock and capital. The Southern states taxed slaves.

National taxation was attempted before the adoption of the Constitution of 1787, but Congress had no power. It could only assess the states. After much discussion this was finally changed, and the new Constitution conveyed to the national Congress "power to collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the U. S.," and to "borrow money on the credit of the U. S." But this large grant was accompanied by decided restrictions. The first is that "all duties, imposts, and excises shall be uniform throughout the U. S." The second, that "no capitation or other direct tax shall be laid, unless in proportion to the census or enumeration" elsewhere provided for. The third, that "no tax or duty shall be laid on articles exported from any state. No preference shall be given, by any regulation of commerce or revenue, to the ports of one state over those of another." On the other hand, it is provided that "no state shall, without the consent of the Congress, lay any imposts or duties on imports or exports except what may be absolutely necessary for executing its inspection laws; and the net produce of all duties and imposts laid by any state on imports or exports shall be for the use of the treasury of the U. S.; and all such laws shall be subject to the revision and control of Congress." The interpretations of the Supreme Court have determined (1) that Congress has no power to levy duties on exports under any circumstances; (2) that no state may tax the "instrumentalities" which the federal government deems proper to create or employ for carrying out its purposes, such as property in the debt of the U. S.

This interpretation of the Constitution has led to the present condition of affairs, whereby the national government has raised its revenues almost exclusively by indirect taxation, and the states have levied almost all our direct taxes. This has meant that the national government has had the most remunerative taxes and the states the most unpopular. It has meant, too, that during large portions of our history the national revenue has been largely in excess of national expenditures. Only in our earliest history in war time and very recently has the revenue been insufficient and resort made to direct taxation by the national government. In 1796 Congress yielded to the pressure of financial necessities, and recommended a direct tax, and in 1798 one was laid on houses, slaves, and lands.

Again during the War of 1812 it was necessary to resort to direct taxation to carry on the government. Here a new feature was introduced, inasmuch as the several states were permitted to assume as states the payment of their quota of the tax. Many states availed themselves of this privilege. Thus was avoided a collection of the

taxes by the U. S. Government at different rates in all parts of the country, and with it the general unfavorable criticism of the system. When again in 1861 it became necessary to resort to direct taxation, the privilege of assuming the payment of the quota was embraced by all the loyal states.

The main national taxation, however, has been indirect taxation through the tariff and the excise duties. (For a history of the former, see *TARIFF*, and for statistics of revenue, see *FINANCE*; *INTERNAL REVENUE*.) For the first years of our national life, burdened with debt, the revenue was by no means excessive, in spite of the excise taxes enacted under Washington's administration; but in 1801 those excise taxes were repealed, and by 1806 President Jefferson announced to Congress that the tariff revenue would soon be more than sufficient to meet the constitutional wants of the government, and proposed that the powers of Congress be enlarged to enable it to undertake a great system of internal improvements. The outbreak of the war with Great Britain postponed the appearance of a surplus revenue and forced the reenactment of excise taxes. But in 1829 General Jackson announced the reappraisal of a surplus revenue, and in 1836 a law was passed to deposit the surplus revenue with the states in quarterly instalments. These deposits were made and were used for education, etc., but the business depression of 1837 and the failure of the state banks compelled the treasurer to suspend the fourth payment, and he was supported in so doing by Congress. Owing to the Mexican War and bad financial management, there was no surplus before the war, but in 1860 a debt of \$61,140,496. The expenses of the war caused "the war tariff," excise taxes, and direct taxes, besides large loans, and for twenty years after there was no surplus. But by 1887 the policy of the funding of the debt, putting a large part of it out of reach for redemption at par, there came to be a large surplus, even tho most of the war taxes had been repealed. It had come to be a practical question in national taxation what to do with the surplus revenue. It did not remain so. The growth of the pension list, which has come to be among the heaviest expenses of the government (see *REVENUE*), with heavy appropriations for internal improvements, etc., for a time more than exhausted the revenue. This was remedied by the passage of the Dingley tariff and more recently by the increased revenues of the taxes levied at the time of the Spanish War, some of which still continue. (See *PROTECTION*. For present national taxes, see *FINANCE*; *INTERNAL REVENUE*. See also *INCOME TAX*.)

Coming to state taxation, we have seen that the systems of state taxation inherited from the colonies were most diverse and confusing. This diversity has largely continued.

State Taxes They are all, as has been said, direct taxes. At first the general aim was to tax according to ability to pay.

In Connecticut, till 1814, taxation was first upon property according to its probable net revenue. In Ohio, till 1825, land was divided into three classes, according to quality, and there were three rates of taxation per 100 acres. In 1825 a clause was introduced providing that land should be taxed without taking into consideration the actual improvements thereon. In Maryland there was a direct tax for local purposes on the direct

value of all property. Other states followed in the main the systems of taxation inherited from the colonies. (See above.) Generally speaking, the effort to tax all property according to income proved a failure, and the tendency has prevailed to tax according to selling value, this change being made in most states in the "forties." Another change, too, was generally made about the same time. The old specifications of property failed to reach large masses of wealth. The attempt now is to tax all property according to selling value. The constitution of Ohio, adopted 1851, expressly provides that even state and local bonds shall be taxed. Nevertheless, this attempt to tax all property equitably according to its selling value has not succeeded. In many states the opulent pay taxes on little more than what property they choose to return. The widows, and the helpless, and the conscientious, whose property, being in the hands of the courts, is easily measured or fully returned, pay full taxes. The rich who will largely escape taxation on personal property. In Ohio, where the most strenuous efforts have been made to reach all property, the governor reported that "in 1883 the valuation for taxation of the personal property of the state, as shown by the grand duplicate, was \$542,207,121. In 1884 it shrunk to \$528,298,871, and for 1885 dwindled again to \$509,913,986. This loss has been made up largely by the steady growth of the valuation of real estate on account of new structures, etc., but the loss was greater than the increase last year" (Professor Ely's "Taxation in American States and Cities," p. 157). Says the preliminary report

In New York State the assessors, in their report for 1881, say:

Women, heirs, executors, administrators, guardians, and trustees of persons of unsound mind are assessed beyond all measure of justice. . . . The same assessor, however, if not forgetting his oath when inquiring of the wealthy neighbor as to his personal property, very likely accepts the negative answer as truthful, tho it is well known to the community that he possesses large means. The one has not yet learned how to cover the personal property by an assumed indebtedness, while the other is well versed in the many devices by which he may escape even the "diligent" assessor (*idem*, p. 174).

A careful study, however, of the present condition of city taxation in the U. S. is the Eighth Biennial Report (1894) of the Illinois Bureau of Labor Statistics, of which George A. Schilling was secretary. It is an exposé of the crookedness and inequalities of the present system of assessing and levying taxes, and of the extent to which wealthy individuals and corporations escape taxation. Applying to Chicago, it is notoriously representative to a greater or less degree of all our larger and some of our smaller cities. Its value may be seen in the fact that the original edition of 45,000 was exhausted in a few months, and a special edition called for. The report considers the whole subject at length. We can quote from it only some of its findings as to the assessment and taxation of personal and land property. It shows, in the first place, the extent to which personal property escapes taxation. The following table shows the amount of personal property assessed in Cook County (the city of Chicago) and outside of Chicago, and also the relative property of bankers which is assessed and that of other classes of citizens:

ASSESSED PERSONAL PROPERTY OF BANKERS, BROKERS, ETC., AND OF OTHER CLASSES¹

| AREA | Population by United States Census, 1890 | ASSESSED MONEY | | AMOUNT PER CAPITA | |
|---------------------|--|----------------|---------------|-------------------|---------------|
| | | Bankers, etc. | Other persons | Bankers, etc. | Other persons |
| Illinois..... | 3,826,351 | \$3,120,555 | \$7,769,358 | \$0.816 | \$2.03 |
| Cook County..... | 1,191,922 | 43,925 | 434,244 | 0.037 | 0.364 |
| Other counties..... | 2,634,429 | 3,076,630 | 7,335,114 | 1.168 | 2.784 |

ASSESSED CREDITS¹

| AREA | ASSESSED CREDITS | | AMOUNT PER CAPITA | |
|---------------------|------------------|---------------|-------------------|---------------|
| | Bankers, etc. | Other persons | Bankers, etc. | Other persons |
| Illinois..... | \$1,563,583 | \$11,343,365 | \$0.409 | \$2.968 |
| Cook County..... | 10,000 | 522,110 | 0.008 | 0.438 |
| Other counties..... | 1,553,583 | 10,821,255 | 0.590 | 0.108 |

¹ Tabulated from Eighth Biennial Report of Illinois Bureau of Labor.

of the West Virginia Tax Commission, made in 1884:

At present all the taxes from invisible property come from a few conspicuously conscientious citizens, from widows' executors, and from guardians of the insane and infants; in fact, it is a comparatively rare thing to find a shrewd trader who "gives in" any considerable amount of notes, stocks, or money; the truth is, things have come to such a condition in West Virginia that, as regards paying taxes on this class of property, it is almost as voluntary and is considered pretty much in the same light as donations to the neighborhood church or Sunday-school. . . . The statistics bearing on this point will scarcely be credited by persons who have not investigated the subject (*idem*, p. 174).

As further illustrative of the undervaluations in Cook County, tables are presented which show that, according to the report of the state auditor, the net taxable credits and moneys of twenty-seven state banks in Chicago, on June 5, 1893, amounted to \$1,058,105.25 and \$18,991,771.67 respectively, while the amounts of these items listed for taxation, May 1, 1894, by all the banks in the city (national banks excluded) amounted to \$10,000 and \$43,925 respectively.

Of the utterly unjust assessments of real estate, the report gives equally plain evidence.

The extent of the undervaluation for the purpose of taxation is first illustrated by a series of tables, that compare the cost of buildings erected during a number of years, as shown by the building permits, with the assessed value of all real estate. The following statement summarizes the general results of the comparison:

COST OF BUILDINGS AND ASSESSED VALUE OF ALL REAL ESTATE IN CHICAGO

| | |
|--|---------------|
| Buildings erected 1876 to 1893..... | 63,301 |
| Cost..... | \$418,144,603 |
| Average cost..... | \$6,605.66 |
| Per cent of total cost..... | 100.00 |
| Assessors' valuation, all real estate, 1893..... | \$123,745,832 |
| Per cent of cost of buildings..... | 29.59 |
| Cost of buildings erected 1890, 1891, and 1892..... | \$129,364,250 |
| Per cent of assessed value of all real estate, 1893..... | 104.54 |

Leaving out entirely the buildings erected prior to 1876 and still standing in 1893, and omitting land values altogether, the assessment valuation in 1893 of both land and improvements was less than one third of the cost of the buildings for which permits were granted after the close of 1875.

A description is given of seventy of the costliest commercial buildings of the city, with the true and the assessed value of the land and the buildings separately shown, and the percentages of the assessed to the true values; similar showings are also made for a number of costly and a number of cheap residences. The increase in the true value of some of the commercial and costly residence property is compared with the decrease in the assessment value. Comment is also made on the constantly increasing value of land and decreasing value of improvements, with almost stationary assessment values.

In comparing values for old and new style office buildings, it is found that while in both cases the site value exceeds the value of the buildings, the proportion is much greater in the case of the old buildings. For forty-four new buildings the site

variation between the percentage of true value at which buildings are assessed and that at which building sites are assessed appears to be about the same for all classes of property.

Apart from its obvious tendency to obstruct improvement, the report states that "a custom of assessment for taxation like that above described must therefore in its very nature discriminate against the owners of improved property according to the greater value of their improvements relatively to the value of their land. And this operates with special force against owners of cheaper properties." Comparing a business property valued at \$800,000 with a residence valued at \$8,875, it is shown that for the business property the ground was 87.50 per cent and the building 12.50 per cent of the total value, and for the residence the ground was 21.13 per cent and the building 78.87 per cent. The assessed value of the land in the case of the business property was 7.29 per cent, the building 27 per cent, and the total 9.75 per cent of the true value. For the residence property the percentages were, land 5.33 per cent, building 15.71 per cent, and total 13.52 per cent of the true value. In these two cases the assessment valuation is, in proportion to actual value, lower on the cheaper property, both as to site and improvement, than on the business property; and yet the total assessment valuation of the cheaper property is 3.77 per cent greater, as compared with the total real value, than the total assessment of the business property.

A number of tables are presented which show the quantity and assessed value of real and personal property, also of railroad and other corporate property throughout the entire State of Illinois, with appropriate comparisons with similar values for the State of Indiana. These statistics are shown in detail by county totals, comparisons being made between the totals of 1873 and 1893. The two final summary tables are in substance as follows:

ASSESSED VALUATION, ALL CLASSES OF PROPERTY, ILLINOIS

| CLASS OF PROPERTY | ASSESSED VALUES IN— | | Decrease | Per cent of decrease |
|--|---------------------|---------------|---------------|----------------------|
| | 1873 | 1893 | | |
| Personal property..... | \$287,292,809 | \$145,318,406 | \$141,974,403 | 49.42 |
| Lands..... | 582,416,667 | 320,964,855 | 261,451,812 | 44.89 |
| Town and city lots..... | 317,199,285 | 293,274,185 | 23,925,100 | 7.54 |
| Railroads (all property)..... | 133,807,823 | 82,270,090 | 51,537,733 | 38.52 |
| Corporations other than railroads..... | 20,806,462 | 5,363,979 | 15,442,483 | 74.33 |
| The city of Quincy..... | 13,788,271 | 1 | 13,788,271 | |
| Total..... | \$1,355,401,317 | \$847,191,515 | \$508,209,802 | 37.50 |

¹ Assessment of the city of Quincy included in Adams County.

value was 50.84 per cent of the value of both land and buildings, while for sixteen old buildings it was 74.23 per cent. In the case of eight lots in a choice residence portion of the city the value of the ground is shown to have increased 556.59 per cent between 1882 and 1893, while the assessed valuation increased 76.55 per cent, and the per cent that the assessed is of the true value decreased from 21.72 in 1882 to 5.84 in 1893. The assessed value of the improvements on these lots in 1893 was 15.82 per cent of the true value. For ninety-eight unimproved lots the assessment for 1893 was 4.88 per cent of the true value, while for twenty buildings it was 13.54 per cent. The va-

The report gives many concrete examples of the way real estate is undervalued, and so escapes taxation. Of thirty residences ranging in value from \$20,000 to \$1,300,000, the report says:

The highest assessment shown is only 12.33 per cent of true value. That is the assessment valuation of the residence No. 112 Lake Shore Drive, worth \$130,000. The residence Nos. 87-102 Lake Shore Drive, worth \$1,300,000, is assessed at only 5.54 per cent of true value; its millionaire owner pays considerably less than half the tax for his home, in proportion to value, that is paid by the owner of the \$130,000 home. The owner of the least valuable home in all the list, the residence at No. 2829 Indiana Avenue, pays on a 9.5 per cent valuation—nearly double the proportion paid on the millionaire residence; and homes worth but little more than the minimum limit of the list—those at Nos. 2241 and 2243 Michigan

Avenue—are taxed upon 11.03 per cent of true value; or proportionately within a very small fraction of double the tax upon the millionaire home. Some of the comparatively modest places are taxed at a low valuation. One worth \$50,000 is taxed upon only 4.87 per cent of its value; one worth \$67,500 is not much worse off with a tax upon 6.30 per cent of its value; one worth \$60,000 is assessed at 4.08 per cent of its value, and one worth \$90,000 is assessed as low as at 4 per cent of its value. The average valuation of the thirty properties is but 7.78 per cent of real value.

How can this fraudulent character of these valuations be doubted? Make all possible allowance for differences of opinion, and still assessors cannot explain the valuation of \$50,000 property at \$2,430; of \$90,000 property at \$3,600; of \$175,000 property at \$7,980; of \$1,300,000 property at \$71,900, and so on. And what explanation can the owners make? They may say it is no part of their business to object to undervaluations of their property; but they would not try to satisfy a merchant with such an explanation of purchases from his clerks at prices so monstrously out of proportion to real value. Why is their standard of honor and honesty so radically different when the issue is with the people instead of a merchant? and over a question of shirking taxes instead of pillooning goods? This question is the dilemma of those owners who passively acquiesce in undervaluations; those who actively promote them have a worse moral problem to deal with.

As an illustration of the way vacant land is undervalued, the report gives the following history of a bit of land formerly known as the Garfield Race-Track, owned by Judge Lambert Tree:

It is unimproved, held for a rise, an eyesore and obstruction to the growing neighborhood, and worth at the present time not less than \$1,000,000. This property was patented in 1835; in 1836 it was sold for \$580; in 1870 it was sold again, the price being now \$50,000. At the next sale, in 1875, the true price was veiled—\$1,000 and "other good and valuable property" being the consideration expressed. In 1870, the year the property sold for \$50,000, it was valued by the assessor at \$39,960, and by the Board of Equalization at \$37,562, and taxed \$8,245.50. Since that time the valuation has been slightly increased and the tax slightly reduced, as follows:

| YEAR | Assessors' valuation | Board's valuation | Taxes |
|-----------|----------------------|-------------------|------------|
| 1870..... | \$39,960 | \$37,562 | \$8,245.50 |
| 1880..... | 40,530 | 49,042 | 2,430.75 |
| 1890..... | 101,200 | 119,416 | 7,737.05 |
| 1893..... | 88,600 | 106,320 | 7,768.59 |

It will be observed that the highest valuation—that of 1890—is but little more than double the price paid in 1870, long before the thick population that now surrounds the property had begun to drift in that direction. The valuation for 1893 does not exceed 10 per cent of the true value.

For further facts as to city taxes, see CITIES.

A more recent report, that of the Commission on Revenue and Taxation of the State of California, 1906, has the following indictment of the present system which will apply with but slight modification to the conditions prevailing in most other states:

1. In general the present system of taxation does not meet the demands made upon it. It is antiquated, having been adopted fifty years ago, and has not been revised to keep pace with modern conditions.

2. It is full of inequalities, which impose a handicap on the growth of the state, a handicap which only the vigor and inexhaustible energy of our people can carry.

These inequalities twist and distort our industries and prohibit a symmetrical development of our resources. They place an undue burden upon agriculture, and especially, the foundation of our wealth, the one industry which most fully exploits the great natural resources of the state.

3. The taxes paid by farmers in California are equivalent to an income tax of 10 per cent. This is in contrast to many other industries; for example, the taxes paid by manufacturers which amount only to a per cent on income. The persons engaged in agriculture, with an average yearly income of about \$500, pay \$50 per capita per annum in taxes. The persons engaged in manufactures, with an average annual income of \$870, pay \$17.50 per capita per annum.

4. Our chief tax, called a general property tax, has in fact become a real estate tax. Only from 15 per cent to 18 per cent of the entire taxes are levied on personal property.

5. The amount of personal property on the tax rolls to-day is hardly larger than it was in 1872.

6. Money and credits escape taxation almost entirely. Our laws in regard to the taxation of this class of property are full of absurdities and utterly unenforceable. It is unwise to retain these provisions on the statute-books.

7. National banks pay no taxes at all, except on real estate, of which they are not permitted to hold much, by the provisions of the federal laws.

8. State commercial banks, subject to our tax laws, are badly handicapped by the competition of the untaxed national banks. Many of them have become national banks partly for the reason that they would not then be subject to taxation.

9. State commercial banks, to live at all, in face of this competition, are forced to evade taxation whenever possible and are hampered in their investments by unwise provisions of our tax laws.

10. Savings-banks, which harbor the savings of the workers and which are, in many states, granted special rebates in taxation on that account, are the only class of banks which pay their full quota of taxes.

11. "Equalization," so called, does not equalize, and in the nature of things, cannot equalize. After the officers have exhausted their best efforts in this direction there are inequalities—glaring ones—between real estate and personal property; between different classes of personal property; between county and county; between city and city; between city and country; between man and man. All of which are rarely removed and often intensified by so-called equalization.

12. The original inequalities in the assessment are intensified by the constant piling up of tax on tax on the same base. If a city has a rate of \$1, which may be "reasonable" enough, there often comes on top of that a county tax of another \$1, a few special school taxes, or a sewer tax, or a tax for bonds, or a levee tax, or a drainage tax, etc., until the effects of any inequalities in the original assessment have been multiplied anywhere from two- to fivefold. Aggregate tax rates falling on city property range from \$1.65 per \$100 to \$5 per \$100 of assessed valuation.

13. Counties with relatively undeveloped resources often have very high tax rates on relatively high valuations, while some of the richest counties enjoy a low tax rate on low valuations.

14. The present system takes the revenue derivable by taxation from large general organizations, like the railroads, which revenue belongs by right to the people of the state at large, and distributes it most inequitably among the local divisions of the state which have no proper claim to it whatsoever.

15. Under the present system it is impossible to adjust the burden of taxation equitably between different classes of corporations.

16. Our present system is a "school for perjury," puts a penalty on honesty, and pays high premiums for dishonesty.

IV. The Theory of Taxation

The theory of taxation may be considered under three heads: (1) the canons of taxation; (2) its incidents; (3) particular taxes. The canons of taxation—i. e., the characteristics by which taxes are to be measured as wise or unwise—are usually based on the four classic canons laid down by Adam Smith. They are in Smith's words as follows:

1. The subjects of every State ought to contribute to the support of the government as nearly as possible in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the State. In the observation or neglect of this maxim consists what is called the equality or inequality of taxation.

2. The tax which each individual is bound to pay ought to be certain, and not arbitrary. The time of payment, the manner of payment, the quantity to be paid, ought all to be clear and plain to the contributor and to every other person. Where it is otherwise, every person subject to the tax is put more or less in the power of the tax-gatherer, who can either aggravate the tax upon any obnoxious contributor, or extort, by the terror of such aggravation, some present or perquisite to himself. The uncertainty of taxation encourages the insolence and favors the corruption of an order of men who are naturally unpopular, even when they are neither insolent nor corrupt. The certainty of what each individual ought to pay is, in taxation, a matter of so great importance, that a very considerable degree of inequality, it appears, I believe, from the experience of all nations, is not near so great an evil as a very small degree of uncertainty.

3. Every tax ought to be levied at the time or in the manner in which it is most likely to be convenient for the contributor to pay it. A tax upon the rent of land or of houses, payable at the same term at which such rents are usually paid, is levied

Canons of Taxation

at a time when it is most likely to be convenient for the contributor to pay, or when he is most likely to have wherewithal to pay. Taxes upon such consumable goods are articles of luxury are all finally paid by the consumer, and generally in a manner that is very convenient to him. He pays them by little and little, as he has occasion to buy the goods. As he is at liberty, too, either to buy or not to buy, as he pleases, it must be his own fault if he ever suffers any considerable inconvenience from such taxes.

4. Every tax ought to be so contrived as both to take out and to keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the State.

The subject of the incidence of taxation is one of the most involved and debated in economic science. Professor Seligman, in his "The Shifting and Incidence of Taxation,"

Theory of Incidence traces the history of the doctrine of incidence, and finds nine different theories besides those which he calls early theories. The early theories he divides into those favoring a general excise tax (Hobbes, Cradock, Munn, Petty), those that favored a single tax on land (Locke, Davenant, Cantillon, and others), those that favored a more elastic system (Hume and Steuart). The first developed theory which he considers is that of the physiocrats (*q. v.*). They held that as land is the only original source of wealth, all taxes should be on land alone, and then cannot be shifted, while any other tax will be shifted. The absolute theory, he says, was outlined by Smith and perfected by Ricardo. According to this, a tax on pure rent will remain on land. Other land taxes and all special taxes on commodities not included in the laborer's standard of life will be shifted on to the consumer. All general taxes on agricultural produce; on wages, or on profits come from the capitalist. These conclusions are derived from the Ricardian doctrine of rents, wages, and the residuum of profits. The equal diffusion or optimistic theory, that all taxes are generally diffused on consumers, Professor Seligman criticizes severely, tho he finds it accepted widely, especially in America. The germs of it he finds in the Italian economist Verri, and especially in Canard. It is accepted by Thiers, Courcelle-Seneuil, Cherbuliez, Prittwitz, Stein. America, however, Professor Seligman says, is "the only country in the world where the doctrine is still upheld, and the chief representative of this easy-going, complacent doctrine is David A. Wells." The pessimistic theory, held by Proudhon, also believes that all taxes fall on the consumer, and that this cannot be helped in any form of taxation. The capitalization or amortization theory argues that the land tax falls exclusively on the landowner, and that hence the taxation of land is simply equivalent to depreciating the value of the land by the capitalized value of the tax. From this is deduced the conclusion that after the tax is once imposed it makes no difference how much the tax is, provided it be constant, since, whatever it is, its capitalization has been subtracted once for all from the value of the land. The germ of this theory Professor Seligman finds in John Craig. German writers like Sartorius, Hoffman, and Murhard, went so far as to say that a land tax was no tax at all; this has been to some extent accepted by modern economists like Garnier, Wolowski, Cherbuliez, Walras, Leroy Beaulieu. Rau discusses the theory, and shows that it is only true so far as the value of land depends on its net produce, and this only so far as the produce does not change, and this is true not only of land, but of any commodities of varying value capable of sale. Under

the head of the eclectic theory, Professor Seligman groups those who criticize all the above theories, among them J. B. Say, Sismondi, Garnier, Parieu, Von Thünen, Von Hock, Rau, Prince-Smith, Jones, Senior, Mill, McCulloch, Cliffe-Leslie. All these deny that any of the above theories work without exception. The negative or agnostic theory of Held goes further and denies the above theories. Held argues that all profits like land profits depend on the difference between the greatest cost and market price. The Socialist theory Professor Seligman calls Lassalle's teaching, that indirect taxes are all those not assessed on income or property, and fall on the laborer, who, even in Germany, has not been quite squeezed down to starvation. The last theory which Professor Seligman considers is the quantitative or mathematical theory, as developed by Cournot, Jenkin, and Pantaleoni. The treatise of the last named Professor Seligman considers the best existing treatment of incidence. This theory is, however, a method rather than a theory. It regards incidence as bound up with the theory of value (*q. v.*).

With such contradictory views as to the general theory of incidence, it is wiser to discuss concrete taxes than any general principles.

Taxes are usually divided into direct and indirect. Taxes are called direct taxes when the payment is made by the person taxed.

Indirect taxes are paid, in the first place, by merchants and tradesmen, but it is understood that they recover the amount paid from their customers. The principal taxes consist of the customs duties levied upon articles, when they are imported for use in this country, and excise duties, or duties levied upon goods produced within a country.

The form of direct tax most approved is undoubtedly land taxation. The subject of the incidence of land taxation is so important that we quote at length on the subject from Professor Seligman. He says:

Theoretically there may be five kinds of land taxes:

1. Tax on economic rent.
2. Tax on profits from agriculture.
3. Tax according to net produce.
4. Tax according to quantity.
5. Tax according to selling value.

A tax on economic rent can never be shifted. Here all writers are agreed. As regards the other taxes, Ricardo maintained that a tax on the value of land or on produce will raise prices and fall on the consumer. Ricardo's theory would hold good on two conditions: First, that there was an absolute mobility of capital and labor; and, secondly, that the community in question was an isolated one. It is assumed that the farmers will abandon the land rather than cultivate it at a loss, and that a decrease of supply will raise price. Now it may happen that an increase of price will often lead to a decrease of consumption, which again will react on the price, so that at best only a part and not the whole of the tax would be shifted to the consumer. But in actual life it is a difficult matter for producers to decrease the supply of agricultural products. The tax would often simply have the influence of reducing the farmer's profits.

In the case of cities we may have four cases:

1. When the tax is levied on the ground-owner the case is simple. The value of a lot is fixed by the law of monopoly value. Its price will be entirely unaffected by the imposition of a tax.

2. The tax may be levied on the house-owner apart from the question whether or not he is the land-owner. Buildings represent the investment of capital and labor. A special tax imposed on the building-owner can therefore generally be shifted.

A distinction must, however, be drawn between houses already constructed and those built after the tax is imposed. In exceptional cases the tax imposed on old houses cannot be shifted.

3. The tax is levied on the ground-owner, who is at the same time the house-owner. We need here only combine the two preceding cases.

City Real Estate

4. The tax is assessed on the occupier according to rental value. It is generally supposed that the ground rent part of the tax will be shifted to the ground-owner. But this is not always true, for three reasons: 1. The ground rent may be so low and the rent so high that the builders cannot afford to erect any more houses. This means an increase of the rents. 2. In the course of long leases any intervening increase must rest on the occupier. He cannot improve his condition until the expiration of the lease. 3. But even in the case of short leases, it is not true that the tax can always be shifted. If the competition for lodgings be such that the rent is \$200, the occupier who has been paying \$10 as the ground tax proportion of the whole tax will not pay any less rent for the premises if his tax is increased to \$15. It might, indeed, cause the tenant to live in a less desirable locality—i. e., lower his standard of life. The occupier could evade the tax, but he could not shift it.

Taxes on other property than land obey still more complicated laws of incidence. Taxes on luxury cannot be shifted, but they are expensive in collection, depend mainly on the conscientious reporting by citizens of their own wealth, with the result that they fall only on a few conscientious citizens, and produce a great deal of dishonesty, with a very small profit for the State.

Taxes on income, on inheritance, are of very great importance, but of such importance that we consider them under special articles. It is

Taxes on Capital

generally held that taxes on capital, on investments, etc., can be shifted. If all capital were mobile, its taxation could undoubtedly be shifted; but for various reasons, such as the condition of the market, expense of the process, all capital cannot be moved, and then the tax cannot always be shifted. Taxes on railroads, street-car corporations, etc., so far as they are not taxes on land values, can theoretically be shifted on to the people who patronize the cars, etc.; but practically they often cannot, as the rates are sometimes fixed by law, more often by a custom, which the companies cannot break.

A few other taxes may be briefly considered. Poll taxes, once common, are now rare. They fall unjustly, because they tax the poor man and the wealthy man equally; they bring too little revenue at large expense. In England, they have not been levied since William III. Stamp duties are generally considered more cumbersome than effective, tho in England and Europe generally they are still common. They are usually indirect taxes. The question of taxation is more and more being limited to a discussion which is wiser of two or three great classes of taxes.

V. Tax Reform

(For the position and arguments of the advocates of particular tax reforms, see **INCOME TAX**; **INHERITANCE TAX**; **SINGLE TAX**. For the arguments for and against duties for protection, see **PROTECTION**; **FREE TRADE**.) Generally speaking, other propositions to reform taxation may be divided into the two great classes of those who would concentrate taxation upon land and those who, in various ways, would seek to tax all personal property. As representative of the former class, we quote a short paper read by Prof. S. M. Dick, before the American Economic Association, Aug. 24, 1892. He says:

All writers and teachers dealing with the subject of taxation, so far as I know, are agreed that the American taxing system is faulty and ought to be reformed.

Some of its worst defects are: It puts a premium on dishonesty; it is exceedingly complex; it tends to widen the breach already existing in society. There are two reasons why a reform is difficult to inaugurate: First, the rich men do not want it. Second, the farmers do not want it.

Our present system is a system of 100 years ago. At that time millionaires and monopolies were unknown to America.

Our system was more nearly just then than it is possible for it to be now. Since new factors of wealth have been introduced, new methods of taxation are necessary.

Land Taxation

In 1826 the personal property in Ohio was nearly equal in value to the real estate. In 1889 the realty amounted to \$1,213,645,052. while the personal property is listed at only \$540,552,592. Assuming that the personal property is worth as much as the real, we have \$673,092,760 of taxable personal property bearing no portion of the public burden. In the city of Cincinnati in 1867 the personal property was valued at \$68,412,285, and the real at \$68,596,040, while in 1880 the real was valued at \$129,956,980, and the personal at only \$37,578,376. This apparent decrease of personal property is not limited to Cincinnati. The same is true in other large cities in Ohio. Personal property, therefore, escapes taxation. The most logical basis for a system of local taxation is real estate. The taxation of mortgages is a question of great interest to the people of the United States, since the census of 1890 shows that there are 12,690,152 families and 9,000,000 of mortgages in the U. S. Mortgages, so far, have not been successfully taxed.

If taxation were on real estate alone in Ohio, those counties most given to farming would save, per annum, from 15 to 30 per cent of all the tax now paid for state purposes.

Had real estate alone been taxed in 1891, and had the same amount of tax been required for state purposes that was demanded, the four counties containing the four largest cities in Ohio would have paid \$147,889.30 more than they did pay. The four cities would have paid much more than this, and the farm hands in those counties would have saved a large per cent of their tax.

It is very evident from the facts ascertained in the investigation that Ohio farmers would be largely the gainers if personal property were exempt from taxation.

The above paper is not, however, to be understood to commit Professor Dick or his fellow thinkers to a sole tax on real estate. It was shown in the debate that followed that the professor would not limit taxation to this. On this point Professor Seligman said (and Professor Dick agreed with him):

The thought is perhaps in harmony with that of a large number of tax reformers in this country, that the best basis, or at least a very good basis, for local taxation would be real property. Henry George goes one step farther, and maintains that the basis should be land exclusive of improvements. My objection is that while the plan has many advantages of ease and convenience of collection, and of non-inducement to fraud, it fails of equality and uniformity. There is no doubt that after all the contests over principles of taxation, modern science has settled down on a taxation according to ability and means rather than on a taxation according to benefits, tho it is true that in local taxation this principle must be modified somewhat by the principle of benefits to the individual and his property. As real property has a large share of the benefits of state and municipal protection, it ought to bear a large share of the taxation. It is hopeless to suppose that the farmers of this country will ever consent to abolish the tax on personal property unless we replace it by something which will reach the bondholders, and tax the holders of millions who did not get their wealth from real estate. No system of local taxation can be worked out without taking into account the general state and national taxation system, all three systems trying to get at the faculty of the individual.

This general proposition to concentrate taxation on land is the one supported by the report of the Illinois Bureau of Labor, quoted above. It says:

To adopt the site-value method of taxation is to invite general prosperity. With personal property exempt, its increased consumption would increase the demand for it, and consequently multiply business opportunities in connection with making, carrying, and selling it. With landed improvements also exempt, larger and better homes would be demanded, to the stimulation of all branches of the building industry. With vacant lots taxed the same as if improved, and so much that it would be unprofitable to hold them long out of use, speculative values would decline and business be no longer obstructed by exorbitant prices for location.

Working men would pay in taxes only what their ground rent privileges were worth. Farmers would pay in taxes not more than their farms would rent for if wholly denuded of buildings, fences, and drains, and turned back into raw prairie. Every one would be benefited through reduced taxes, or better incomes, or both—every one except the mere monopolizer of public benefits.

And the cry of fraudulent taxation, on any other account

than an occasional personal dereliction, like a post-office embezzlement or a bank robbery, would be heard no more.

Simple, practical, natural, scientific, and just as the site-value tax doubtless is as a method of raising public revenues, it is at the same time recommended by its supporters as the solution of the labor question, or, more correctly, as the natural way of reinvesting every laborer with power to settle his own labor question for himself. For it is not the power of employers, but the necessities of the unemployed or the inadequately employed, that makes employment precarious and wages low. It is not the clubs of policemen nor the weapons of soldiers that defeat strikers; it is the underbidding of men in worse plight than the strikers. The simple remedy is by freeing business from monopoly and tax burdens to open the way for unlimited opportunities for employment, so that none need take another's place in order to get remunerative work himself. This, it is claimed, the site-value tax would do.

As an example of those who strive to tax personal property more rigorously we quote the Hon. Mr. Winn, in an address made in Faneuil Hall, Boston, Oct. 7, 1891. He said:

When personal property is all taxed, the owner of a house cannot collect the tax on it from his tenant by making him pay more rent. He must bear his own taxes.

But, when personal property is permitted to escape, the landlord can make his tenant bear the tax on the house by charging that much more rent.

The reason is that, if capital in buildings escapes taxation by throwing the tax on the tenant, capital outside, if taxed, will flow into buildings to get the same advantage, till it can be got no more.

But if the outside capital is not taxed it will not flow into buildings, which always are taxed, until the tenants are willing by a higher rent to bear the new tax the capital has to assume.

Taxation of Capital This is the very key to the situation. Here is the method by which the rich throw their taxes over on to the poor, who are not in the tax lists at all. They get chattels exempted, or take care that the laws are lax enough

to permit their escape from taxation. And by this the poor men who have no property whatever, but who must have shelter, and who never dream they are paying taxes, are haled in to bear not only the taxes of the tax-dodging millionaire, but those of their landlords as well.

Data have been collected which show that the rent of the poor whose incomes are less than \$1,000 is four times as great according to their means as the rent borne by persons whose incomes exceed \$7,500. So a tax on rent, if borne by tenants, is grossly disproportionate.

Come at it from another direction. The report of the tax committee of the Boston Executive Business Association, written by one who desires to exempt this class of property, and who would naturally underestimate its amount, declares:

"The personal property of both city and state, which under the law is subject to taxation, cannot be less than twice the value of the real estate."

If this is so, more than \$2,000,000,000 escapes taxation, and the people are cheated out of about \$17,000,000 per annum. I understand that Mr. Robert Giffen estimates the wealth of England to be about one sixth in land. Applying this scale to Massachusetts, and somewhat less than \$1,700,000,000 escapes taxation, and the loss of taxes is \$14,000,000 to \$15,000,000.

I believe that the whole assessment of estates should be in the hands of the Tax Commissioner, who should appoint the local assessors, and that they should be paid by the state. I believe that the tax on private personal property should be an excise—a state tax at a uniform rate through the commonwealth—which should be the average tax rate as now laid on corporations. I believe that the personal property tax collected should be distributed to the cities and towns in proportion to the value of their real estate, with such concession as may be reasonable to places of taxpayers' residence. Or that the state should help the municipalities with the proceeds in the support of schools and roads and such other expenses as the state may wisely assume. I believe that every taxpayer should be compelled to give in a sworn list of his personal property under penalty of double damage at least. And if this is not enough we may adopt the Swiss system of examining the estates in probate.

VI. Separation of State from Local Taxation

Since the Conference on Taxation, held at Buffalo in 1901 in connection with the Buffalo Exposition, there has been a marked movement in the direction of tax reform starting with the separation of state from local taxation as to sources of revenue.

This has been most carefully and extensively

worked out by the California commission above referred to. We quote from them as follows:

The commission recommends:

1. Separation of state from local taxation as to sources of revenue.

This is the first step in reform.

Complete separation implies that the state shall collect its revenues from sources other than a direct levy on real and personal property of individuals, leaving to the counties and cities the exclusive right to tax such property for local purposes.

This will take the burden of direct state taxation off real estate, and save the owners of real estate about \$4,000,000 annually.

It establishes, at once, home rule in matters of local taxation.

It abolishes, at once, any necessity for equalization between counties, and cures the evils state equalization fails to reach.

The property belonging to the subjects selected for state taxation shall, so far as it is reached by the state, whether through its earnings or directly, be exempt from local taxation.

Separation, while not a remedy in and of itself, except for the evils arising from the breakdown of so-called equalization, opens the way for a proper classification of the subjects of state taxation, and makes it possible to tax each class with a greater approximation to equality than is possible without it.

The exact boundary line, the line of "separation," between the state's power of taxation and the powers to be exercised by the counties and their subdivisions, will be defined in connection with each class of subjects selected for state taxation. (See 3b, "New Sources," below.)

2. That an absolute divorce between state and local taxation be the ultimate aim, and that as nearly complete separation as possible be attained at the very outset.

3. That the state derive its revenues from the following sources:

a. *Old sources continued.*

(1) The poll tax.

(2) The inheritance tax.

(3) The tax on insurance premiums (modified to remove existing discriminations).

(4) The annual franchise tax on corporations (modified and made proportional).

(5) All fees now collected.

(6) All collections by state institutions (some of which may be increased).

(7) All earnings of state property and investments.

(8) The revenue from sale of state lands.

N. B.—The right to levy on general property should not be surrendered, but should be resorted to only to make good a deficit.

b. *New sources.*

(1) A gross earnings tax on railroads; street-railroads; express companies; car companies; light, heat, and power companies; telegraph and telephone companies, at rates fixed for a period of six years by constitutional enactment, after which time they may be amended by the legislature, but not more frequently than once every six years.

This tax is to be in lieu of all other taxes except taxes on property not necessarily used in the operations conducted by the companies. The counties and cities would, therefore, be forbidden to tax this class of corporations.

(2) A tax on the shares of capital stock of all banks at 1 per cent of the book value of the stock. The book value is the sum of the paid-up capital and the accumulated surplus and undivided profits.

This tax, like the gross earnings tax, is to be in lieu of all other taxes on the banks, except taxes on real estate, the assessed value of which is, however, to be deducted from the capital before the 1 per cent rate is applied. Cities and counties would be deprived of the right to tax banks except on their real estate and mortgages.

(3) A tax at the rate of 1 per cent on the assessed value of all corporate franchises of every sort, not covered by the above-mentioned taxes, such franchises to be valued by the state Board of Equalization. This tax, also, would be in lieu of local taxes on such franchises.

The separation of state from local taxation as to sources of revenue has come to be generally recognized as the one feasible pathway for tax reform.

Many of the Eastern states have introduced the plan for separation of state from local taxation. Pennsylvania was the pioneer in this line, and has had such a system in force for many years. New York has, after twenty-five years of gradual evolution, attained a similar position. We have selected these two states, together with Connecticut, Ohio, and Minnesota, each with more or less com-

Separation
in Other
States

plete separation, to illustrate the way this plan works in other states.

TCHAYKOVSKY, N. W.: Father of the Russian revolutionary movement, publicist, and propagandist; born 1851 in northeastern Russia. He prepared himself for the University of St. Petersburg, where he studied natural sciences, and was graduated in 1873, altho he was arrested during his final examinations and detained for several months. This, with a number of previous experiences, opened his eyes fully to the arbitrary ways of the bureaucracy, and the uselessness of trusting the czar. He openly espoused the cause of the people, and for thirty years has worked, spoken, and written in their behalf. He knows the people, since he has in turn been school-teacher, farmer, ship-carpenter, laborer in a sugar-refinery, newspaper correspondent, editor, traveling salesman, chemist, superintendent of factories. His extensive travels, including a stay of four years in the United States, and his studies abroad have also given him a full knowledge of free countries. He is the author of numerous pamphlets on the political and industrial situation in Russia.

TECHNICAL EDUCATION AND MANUAL TRAINING: We include under this general heading three subjects which are distinct, altho continually confounded in the public mind—trade education, technical education, and manual training. We consider them under one head, in order

Definitions

that, by placing the subjects side by side, the important differences between them may be clearly brought out. We commence with definitions. Trade education is the preparing of craftsmen for practical work in a particular trade. Technical education is the teaching of the sciences in their practical application to the material interests of man. A good trade-school may be a very poor technical school, while a good technical school is not of necessity a good trade-school. Manual training is different from either; it is instruction in the use of tools as a part of a complete educational discipline. Trade-schools seek to turn out craftsmen; technical schools seek to turn out scientific specialists and professional men, such as civil engineers, architects, etc.; manual training seeks to develop complete manhood and womanhood by developing dexterity of hand as well as head. We must consider the three in their modern chronological development.

I. Technical Schools

Science is modern; scientific schools are therefore modern. When Count Rumford, in 1799, founded the Royal Institution in London, he intended it to be a technical school, altho it was later diverted into a chemical laboratory in which Davy, Thomas Young, Faraday, Tyndall, Rayleigh, and others did their great work. This attempt at founding a technical school had, however, been preceded on the Continent by half a century. The Polytechnicum at Brunswick, Germany, was established 1745; that of *Ponts et Chaussées* at Paris in 1747. Mining schools were founded: Freiberg, Saxony, 1765; St. Petersburg,

Russia, 1773; Clausthal, Prussia, 1775; Paris, 1778. The Polytechnique at Paris dates from 1794; that at Stockholm, Sweden, from 1798. With the beginning of the nineteenth century these schools began to multiply rapidly.

Technical education has reached its highest development and its largest extent in Germany. A sharp distinction should be made between the *technische Hochschulen* and the *gewerbliche Mittelschulen* or *Industrieschulen*. The former require a thorough preparation and correspond really to the university faculties of law, medicine, theology, and philosophy. Graduation from a *Gymnasium* or *Realgymnasium* or *Oberrealschule* is necessary for admission to these schools. They require an attendance of six years for graduation, and grant the doctorate in engineering on the presentation of a satisfactory thesis and the passing of requisite examinations.

The *Industrieschulen* or *gewerbliche Mittelschulen* are satisfied with less preparation, e. g., that of a *Unterrealschule*, *Höhere Bürgerschule*, etc. They intend to furnish a more practical education, at less expense, and, as a rule, somewhat more specific.

Germany had nine technical colleges or *Hochschulen* in 1905. The largest—Berlin-Charlottenburg—has 402 instructors and about 4,200 students, and offered 281 courses. The total number of students in the nine colleges was (1903) 14,626, of whom 2,242 were foreigners; and that of instructors 1,145. The preeminence of Germany in certain industries, e. g., dyeing, is due to these schools. A dauntless, earnest, untiring pursuit of science is preeminently the mission of the German technical high schools of to-day.

The *Industrieschulen* are intended to furnish a general education in technology with the thorough mastery of some particular branch (both theoretically and practically) arising out of local needs and conditions. If one of these institutions has only one department it is called a *Fachschule*, e. g., that at Würzburg, Bavaria, for the construction of machinery. There are at present twenty-four schools belonging to this category; the best known is that at Chemnitz, Saxony, established 1836, with the departments of mechanics, chemistry, construction, requiring three years and a half, and electro-technics, four years.

The schools and museums of industrial art occupy the middle ground between the schools of fine arts and the trade-schools. Their object is to apply the principles of art to the trades, and thus raise the standard of taste. (See article *REVIVAL OF HANDICRAFTS*.) Germany has thirty schools of this kind, scattered pretty well over the whole empire. The applicants for admission must have had some practical experience and a theoretical knowledge of the branch in which they seek instruction. The *Industrie Halle* at Carlsruhe was founded 1865; those at Munich and Berlin, 1867.

The schools for foremen (*Werkmeister*) propose to train experts of medium grade in different branches. Germany has twenty-one schools of this kind; the one at Chemnitz, Saxony, was established 1855; the applicants must have at least two years' experience at their trade, and must be at least sixteen years old.

Germany has schools for almost every individual trade.

Various
Trades

Women have not been neglected in this general educational scheme. Schools for trades which women may choose abound; cooking, embroidery, nursing, textile, commercial subjects, etc., are taught, and efficient workwomen are trained in them. Prussia had (1901) 603 schools with 24,313 students; Bavaria 39, with 3,462; Saxony 24, with 1,800; Württemberg 42, with nearly 6,300.

The lowest industrial schools of Germany are the so-called *Fortbildungsschulen* or continuation schools. They supplement the general continuation schools by giving all kinds of practical information for the earning of a livelihood, and are found in every community where industrial conditions make such instruction expedient. Attendance is generally compulsory. There are nearly 3,000 schools of this character, scattered over the whole German Empire.

Austria has eight technical colleges, or *technische Hochschulen*, supported by the State. They are modeled after those of Germany, with four to six departments. The total number of instructors was, in 1906, 545; that of students, 9,176. The best known is that of Vienna with 112 instructors and 2,774 students.

Belgium has no technical schools which take rank with those of Germany and Austria; but the demand along this line is met to a large extent by special courses in engineering, mining, and manufactures, given by or in connection with the four universities. The students of technology numbered 2,046 in 1904-5.

France has twelve technical high schools which have done excellent work; their combined registration was 1,992 in 1903. The *École Polytechnique*, established in 1794, is the best known; it has 370 students.

England has only two institutions which belong in this class, the Royal College of Science, with 34 instructors and 300 students; the City and Guilds Central Technical College with 33 instructors and 430 students, both connected with London University. The universities supply this need to a large extent by special courses. Other countries which have institutions of this kind are as follows: Hungary, Holland, Italy, Greece, Spain, Portugal, Scotland, Sweden, Finland, Canada, and Japan.

Russia deserves special mention, because she has twelve institutions of higher technical instruction with a total enrolment of 11,356, and because a very large number of Russian students go to Germany and Switzerland to study technology.

Switzerland, too, needs separate mention because of her excellent *Polytechnicum* at Zurich, with 178 instructors and 1,293 students in 1905. It has the six departments usual to a German school of this character and one in philosophical and political science.

The system of instruction in the United States has until recently been based on that of England; that is, the schools of technology were not *graduate* schools, but received students with widely differing preparation, altho graduation from a high school was usually required in the better class institutions. The requirements for admission have, however, been raised

constantly until they are equal to those of the best colleges; permitting, of course, the substitution of scientific, mathematical, and modern language studies for Greek and Latin. The instruction is

of the same grade as in the colleges, altho along different lines. In 1903 there were forty institutions of this kind with instructors as follows: preparatory departments, 107 men, 34 women; collegiate departments, 1,506 men, 120 women; total number of men, 1,586; women, 161. The students numbered in the preparatory department, 3,288 men, 804 women; the collegiate, 13,997 men, 1,237 women; the graduate, 203 men, 32 women. Grand total, 19,765 men and 2,614 women. These institutions have 15 fellowships and 951 scholarships. Their equipment is: books, \$65,795, and pamphlets, 159,187, to the value of \$1,176,424; scientific apparatus and machinery worth \$4,451,052; grounds and buildings valued at \$25,171,943; productive funds, \$13,748,820.

The dates of foundation of the more important institutions are: Rensselaer Polytechnic Institute at Troy, N. Y., established in 1824, to train civil engineers; Sheffield Scientific School of Yale University (1847); Lawrence Scientific School of Harvard (1848); Chandler Scientific School of Dartmouth (1852). In 1862 Congress voted land grants to the several states to enable them to build institutions for teaching agriculture and mechanics. Most of the state universities established scientific schools. Cornell became prominent for its scientific teaching. Washington University, at St. Louis, organized its School of Engineering, and Columbia College its School of Mines. The Massachusetts Institute of Technology was chartered in 1861 and opened in 1865; the Worcester (Mass.) Polytechnic Institute, 1867; the Stevens Institute, Hoboken, N. J., 1871; the Rose Polytechnic Institute, Terra Haute, Ind., 1883; the Case School of Applied Science at Cleveland, in 1891.

In 1906 there were forty-four colleges of this kind with an income of \$6,235,314.

II. Trade-Schools

Trade-schools are attempts to develop craftsmen in place of the apprentice system, which is all but gone. (See APPRENTICESHIP.) Those of Germany have already been described.

Austria has an extensive system of trade-schools which dates back to 1751.

1. *The central industrial educational institutions.* These are all located in Vienna, with the exception of that at Prague.

2. *Schools for important groups of trades.* There are two grades in this class, the higher industrial schools requiring graduation from a *Realschule* or *Gymnasium*, and intending to train in one year specialists for either administrative officers in industrial establishments, or specialists in a particular line, e. g., master builders and contractors, or master mechanics in the railway service, etc., or finally superintendents of breweries, distilleries, etc. For the highest positions along all these lines the course requires four years for completion. The lower schools are those for foremen and are similar to those of Germany. There are eighteen schools of the latter kind.

3. *Schools for particular trades.* They require graduation from a common school, the passing of the fourteenth year, and prepare for special trades, e. g., lace-work and embroidery; weaving, knitting, etc.; wood, iron, and stone work; earthen- and glassware; metal working; house-smithing, machine construction, drawing and modeling, watch- and clock-making, etc. In 1900 Austria had ninety-six State schools of this kind with 8,815 pupils, and sixty-two private schools.

Belgium leaves industrial education to the initiative of the communes and to private enterprise, but subsidizes these schools. The trade-schools for girls antedate those for boys, originating in 1865 in Brussels.

The industrial education of boys is given in the *Écoles industrielles*, which furnish general courses pertaining to industries; in trade-schools, which teach both the theory and practise of a particular trade; in superior trade and technical schools; in Saint Luke trade-schools; apprentice shops for males; and in trade courses for males. The different trades are covered in these various schools.

Canada has aside from its dairy and agricultural schools 7 industrial schools in the province of Quebec, and 6 in that of Ontario.

France finally abolished the guilds in 1791, and established a previously private trade-school as a national one in 1799. Since that time the system has grown, partly through private and partly through public initiative, until in 1900 there were 292 schools receiving government aid. She has

now a remarkably complete system of trade and technical schools, furnishing industrial education from simple operations to advanced training for engineers. The schools present no distinctive features that have not already been presented in connection with other countries. There are 6 national schools of arts and trades, 2 schools of horology, 33 practical schools of commerce and industry (7 of these for girls), 20 practical schools of industry, 35 schools of industries with 5,550 pupils, 13 municipal trade-schools in Paris with 1,385 pupils, and about 370 private industrial schools with 92,000 pupils. Numerous societies provide for courses in weaving, cutting, dress-making, millinery, etc., for girls.

Great Britain has no national system of industrial education, altho she has numerous and, in many cases, fine trade-schools, maintained by municipalities or private institutions.

The City and Guilds of London Institute was organized 1878, and established Finsbury College in 1883.

There are over forty of these higher schools in Great Britain with an ever-growing number of students. The secondary schools are also numerous. They are generally divided into secondary day-schools, or schools of science, of which there are about 230 with 32,625 pupils; in the other class of secondary day-schools partly doing industrial work, there are 253 establishments; so-called science classes are given in 489 schools to nearly 46,000 pupils, earning a grant of £40,859. Science examinations are held in 1,325 centers, and over 18,600 passed first-class, over 31,000 second-class. Besides, there are numerous scholarships and exhibitions, e. g., the Whitworth and the National. The evening-schools, too, are doing considerable work in this line, both as centers of manual and industrial training. Those of them which earned a grant in 1904 numbered 5,579, with 25,517 instructors and 696,882 pupils—422,478 males and 274,404 females. Some took instruction in several subjects, but the majority only in one. There are several museums of industrial art; and the Royal College of Science gives instruction in chemistry, biology, metallurgy, and mining, in addition to other subjects. The total number of schools of art in Great Britain is said to be 230. Industrial education is, however, not as popular as on the Continent owing to a

conflict in laws, one of which holds that trades cannot be taught in a school, while another holds that trades cannot be taught without a school. The great enthusiasm for outdoor sports also militates against theoretical instruction concerning trades. Nevertheless, 34,189 pupils were entered in 1900 in 390 industrial schools, while the London County Council's schools alone had 1,246 pupils in 1901.

Hungary deserves more than passing mention in this connection. Since 1884 every city with at least fifty apprentices is compelled by law to maintain a school for apprentices, at which attendance is obligatory—

Hungary masters failing in their duty in this respect being fined 100 kronen—\$20.30. They have three grades, the lowest intended for boys of twelve years. Instruction is usually given in the evening and comprises, besides cultural courses, nature study, penmanship, bookkeeping, drawing, and sketching. There are about 380 schools of this kind with nearly 80,000 pupils and 2,200 teachers. There are, moreover, twenty schools for journeymen with voluntary attendance and about 1,000 pupils.

School workshops for apprentices form the two links in industrial education.

The State industrial schools form the fourth and highest step in industrial education. They are intended for superintendents, directors, and factory owners, and have a four years' course. The excellent *polytechnikum* in Budapest forms the apex of industrial education in Hungary. Schools of design, needlework, embroidery, etc., for women, also exist in all cities and villages with decent primary schools. The four industrial museums exhibit masterpieces of all kinds, and maintain lectures to workmen, foremen, and owners of shops.

Italy has excelled in industrial arts for several centuries, and education along these lines dates back to the eighteenth century. In 1841 the

Italy Austrian Government established in Venice and Milan two technical schools with an industrial character.

According to a law of 1859 technical schools of a lower grade were established, numbering 280. Nevertheless, industrial education dates from 1870, when Italy became united. They owe their origin chiefly to local and private initiative, and the central government has not unified the system as it has that of general education.

The schools are either industrial or schools of art applied to industry. The three polytechnical schools form the apex, and perform functions similar to the same institutions in other countries, as described under Germany. The industrial and trade-schools of medium grade are intended to train foremen of workshops; those of lower grade to perfect workmen. The former number 8, with about 1,000 students; the latter 68, with about 17,000 pupils. The character of these schools corresponds to that described elsewhere. There are, moreover, two mining-schools, with about 50 students.

Switzerland proposed a school for drawing in 1704, established one in Geneva, 1751, and has increased its industrial schools since to such an extent that the little republic stands at the head of all countries in proportion to its population. The system has been under the Federal Assembly since 1884, and is as perfect as that of Germany. There are (1906) 380 institutions receiving

subsidies from the government, cantons, and communes; and 275 schools for girls similarly subventioned.

Industrial education in the United States may be divided into *public*, *semipublic*, and *private*. The first comprises schools under the supervision of federal, state, or municipal authorities; the second, schools under the auspices of private universities, colleges, and schools of religious and semi-religious societies, of philanthropic and benevolent institutions, etc.; the third class includes all private institutions, associations, or individuals that make instruction in general industrial subjects or in special trades a business. Owing to these differences in control, origin, and motive, the schools vary greatly in method, clientele, and purpose. The government schools, e. g., for Indians, desire to civilize the red man; they have unlimited means at their disposal, and are intended for one class only; their methods must necessarily differ from those pursued, e. g., at Pratt Institute, where usually only grammar-school graduates are admitted, and from those of a small college with large purposes but small means. Again, the private school, e. g., for barbers, aims merely at turning out efficient men at this trade within the shortest time, with least expense, and largest profit to the owner. It is, consequently, impossible to give a general description of methods, as was done in connection with several European countries with their systems, carefully graded by a central authority, without going into lengthy details which are outside the realm of the Encyclopedia. Only this much may be said frankly, that the better-class institutions of the public and semipublic classes have taken the best institutions of Europe for their models, and are doing all that can be expected of them considering the shortness of time they have been in the field. The trouble is, however, that too much is left to the initiative of individuals, with the result that only a comparatively small number of boys and girls are reached. For instance, in 1904 the total number of industrial schools reporting to the Commissioner of Education was 195—i. e., 98 of high-school grade with 36,680 pupils, 52 of elementary grade with 27,793 pupils, 45 Indian schools with 9,260 elementary and 1,032 secondary pupils. To these numbers must be added 996 colored pupils receiving industrial training in public high schools, and 15,743 in secondary and elementary private schools. This makes, including a few other schools not reported, in round numbers 92,500 pupils, male and female, out of an approximate number of at least 1,000,000 who ought to receive such instruction.

The apprentices are, with few exceptions, left to their own devices. Small wonder that they grow up without any knowledge of anything outside of their trade, and no deep knowledge of that. In 1900 the returns for the twelfth census showed 81,482 apprentices and helpers in sixteen trades and miscellaneous industries. Only 2.45 per cent of this total were legally indentured, although in some unions the percentage was 7; that means that they were not even compelled to serve a sufficient time for learning their own trade. Two agencies are trying to ameliorate this woful condition. A number of large manufacturing firms have established apprenticeship schools, besides requiring a definite length of time for learning the trade. Such schools are found in

connection with the Baldwin Locomotive Works, the Midvale Steel Company, the Wanamaker store, all of Philadelphia; the Brown and Sharpe Manufacturing Company of Providence; the Lynn works of the General Electric Company; the Westinghouse Electric and Manufacturing Company, East Pittsburg; the manufacturers of the Hoe printing-presses, New York. The other agencies for betterment in this line are the numerous schools carried on as private trade-schools, e. g., the New York Training School; the Baron de Hirsch Trade-School, the Hebrew Technical Institute, both of New York City; the Drexel Institute and the Williamson School of Philadelphia; the California School of Mechanical Arts and the Wilmerding School of Industrial Arts, San Francisco. Some of these schools are very large and highly organized. Furthermore, numerous and varied classes taught by Young Men's and Young Women's Christian Associations, by the legions of college, church, and other settlements, give an increasing amount of technical education. (See HULL HOUSE.)

While the present condition of intermediate and elementary industrial education is lamentable, there are hopeful signs in the following facts: 1, that our higher technical schools (mentioned above) are fast gaining an excellent standing; and 2, that education along these lines has had a remarkable growth in the U. S. Manual-training schools numbered 15 in 1895 with 3,362 pupils—2,043 males and 959 females—all of high or secondary grade; in 1896 these schools had 4,892 students—3,621 males and 1,271 females; in 1897 the schools had increased to 40 with 13,890 students; 1898, to 58 with 18,977 students; 1899, to 66 with 20,701 students; 1900, to 69 with 24,716 students; 1901, to 78 with 28,981 students; 1902, to 85 with 29,507 students; 1903, to 95 with 33,062 students; 1904, to 98 with 36,680 students. The number of elementary industrial schools has had a similarly rapid, altho more recent, growth. The 195 schools for whites had (1904) a total expenditure of \$1,480,685—salaries, \$1,028,586; materials, \$127,529; new tools and repairs, \$82,060; incidentals, \$242,510. The cost of plants was \$10,197,524.

Perhaps the commercial and business schools should be mentioned here, owing to their rapid development. In 1904 about 4,600 institutions reported 250,231 students taking courses of this kind; 138,363 of them were in regular business colleges; the remainder took courses in departments attached to high and normal schools and colleges.

III. Manual Training

The idea of manual training as a part of education dates from the Reformation; that is, with the final fall of feudalism. The reformers laid stress on the practical side of life against that of asceticism and contemplation. That meant the ennobling of work, and, coincidentally, of manual dexterity. Luther, Comenius, Locke, Rousseau, Pestalozzi, advocated it in one form or another. It was due, perhaps, to these influences that kings, emperors, and princes are now adopting a trade which they are supposed to master. Froebel (q. v.) took the first step in his "Education of Man."

Uns Cygnæus, of the Helsingfors Seminary, Finland, actually introduced manual training beyond the kindergarten age. From there it spread over Finland and Sweden, later over Eu-

rope and the United States. (About manual training for little children, see article KINDERGARTEN.)

Sweden must be mentioned first, because manual training was introduced already in 1876, and has since spread over the whole country. This country has, moreover, a normal school at Nääs devoted to the education of teachers in this line. The Swedish system is called Slöjd (Sloyd), and includes carpentry, turning, and wood-carving; but requires in each case the completion of an article by the same pupil. This system has since been adopted elsewhere.

Sweden

Austria has manual training for girls in every primary school in the department of sewing, needlework, embroidery, etc. Her continuation schools, too, are in the majority of cases non-professional, and impart knowledge and, frequently, practise in one or another branch of manual training, particularly in drawing. For the perfection of the latter accomplishment there exist four general drawing-schools for both girls and boys, three in Vienna and one in Brunn; they are subsidized by the State. Boys receive less attention, because the gymnastic and military training is supposed to supply skill and agility in general, and trade-schools the particular dexterity required. Moreover, nearly every country school has a school garden (*q. v.*) and boys acquire considerable skill in the handling of farm implements. This is certainly manual training, since no less a man than Count Tolstoy depicts (in "Anna Karénina") the joy which filled his heart when he was able to handle a scythe as well as the best farm-hands. What has been said about Austria in regard to continuation schools, school gardens, and training of girls in sewing, etc., applies equally to other Continental countries, e. g., Germany, Belgium, Switzerland, France, Hungary, Italy, and the Scandinavian countries.

Austria

Germany has about 200 schools with workshops; Switzerland has them in more than half the cantons; France has them in every advanced primary school of Paris and of the larger provincial cities; England began in 1887 with the Drapers' Company's gift of £1,000 to the City and Guilds of London Institute for the promotion of manual training. The institute was so successful with its six centers that the government took them over in 1890 and introduced the system both in London and the provinces. Models, apparatus, tools, etc., are furnished by the board. The love of outdoor sports is, tho, a strong counter attraction.

Manual training has had its best and widest development in the United States, with the exception, perhaps, of Sweden. Training of girls and boys and adults in drawing

was introduced in the Massachusetts schools in 1872; St. Louis established a manual training school in 1876, which aimed at an all-round education. Nearly all large cities have since followed that example, e. g., Chicago, Baltimore, Philadelphia, Cleveland. The system has had a very rapid development. In 1890 only 37 cities included manual training, in addition to drawing, in their public schools; 1894 there were 95; 1896—121; 1898—146; 1900—169; 1901—232; 1902—270; 1903—322; 1904—411. That is, out of the 588 school systems in cities over 8,000 population, more than 80 per cent had adopted the system;

and it has extended rapidly since. Manual training is given in the high schools and in the grades for from two to eight years. Some cities give it in both. Drawing, sewing, and other needlework for girls were generally the beginning in the public schools; later the manual training schools introduced joinery, wood-turning, and carving, pattern-making, modeling in clay, molding, casting, forging, machine-shop practise, etc., for boys, and proper branches for girls. From these schools, which taught the cultural branches, too, the system spread into the public schools. Private schools, e. g., Pratt Institute, Brooklyn; the Drexel Institute, Philadelphia, etc., adopted the system readily, and in several cases improved it.

IV. Economic Bearing

Everybody believes to-day in industrial education. The development of the body is recognized as a vital part of education (*q. v.*). Socialists, individualists, radicals, and conservatives, all are agreed at the present that industrial education should be extended as far as possible.

But there is a difference of opinion as to what form this industrial education should take. Working men and many other people favor technical schools and general manual training, but oppose trade-schools. Speaking of manual training, in an address before the Social Science Association in 1884, General Walker says: "It is not so much the creation and endowment of separate schools of this character which is in view, as the gradual conversion of all the existing schools of the land to this use through the grafting of certain studies and exercises upon the traditional curriculum."

This is what working men desire.

Says Mr. George E. McNeill ("Report of Massachusetts Commission on Manual Training," part iii.):

The manual training school is a necessary substitute for part of that which has been lost to the children of to-day.

The "Puritan," sneered at by the dilettante liberals of to-day, was a hard man—hard to contend with, whether in the field of productive labor or destructive war, in religious argument or political debate. He was the best-equipped man of his time. As populations increased, and industries became more diversified, his adaptability was extended.

Every home had its Bible, its library, musket, and tool-chest.

A boy of twelve years of age who could not use the tools required for the manual training school of to-day was held to be below par.

In the crisis of the union, men were found in the ranks of the New England volunteers who could do any kind and all kinds of work, and do it well.

The wage-worker of to-day, whether a hand-tool or a steam-or electric-tool worker, is less and less required to depend upon himself in his work; his opportunities of development in his work are limited, as compared to those of former times.

Handicraft, as a means by which the masses of mankind can earn a living, is being replaced by machine-craft.

Learning a trade is like learning a dead language, useful as an accomplishment, but useless as an investment, save as it interprets a past mystery and disciplines the learner.

The plain men, labor reformers, who studied the industrial conditions and the evolutionary processes of development, foresaw that adaptability and a availability were worth more than skilled ability. They were among the first to advocate and demand the kindergarten and the school of technology. They wrote, lectured, and petitioned that the school should be the place of resistance to the demoralizing influences of the rapidly decaying industrial and social system, and a source of persistence in the direction of the moralizing influences of enlightened civilization.

That some working men should oppose the extension of school work to primary preparation for manual pursuits was to be expected. Men whose occupations are their life must needs be jealous of everything that tends to increase competition. They know by instinct, if not by experience, that wages, under the pressure of competition with other laborers in the same craft, will, like water, seek its lowest outlet; and

they feel that resistance to lower wages, like resistance to tyranny, is obedience to God.

Our public schools are for the training of citizens, not mechanics, merchants, lawyers, or the other professions; and the youth is not correctly trained who enters upon the duties of citizenship with contempt for manual pursuits.

This quotation, perhaps, indicates the position occupied by the more intelligent working men of the world. They honor labor, and believe that all men should labor. They would have manual training taught to everybody, but they fear trade-schools. Trade-schools which, in their opinion, turn out dilettante workmen, feeling themselves superior to "ordinary" workmen, and refusing to develop the necessary trade-unions (see TRADE-UNIONS), they fear and oppose. They do not oppose good workmen, but they do not believe that trade-schools are the place to produce real effective craftsmen. They argue that American and English mechanics who lead the world were not taught in trade-schools, but in the workshop.

They would have in place of trade-schools schools of technology, for the study and teaching of science and manual training for everybody, giving boys and girls that general adaptability to fit them to enter any trade workshop and become skilled craftsmen. On the other hand, many people regret the rule of machinery, and believe we need besides the teaching of the workshop, where money values alone rule, the teaching of trade-schools, as in Europe, to teach hand-carving, artistic weaving, pottery-making, and good work of every kind. (For the question whether industrial education should be in the hands of the State or private individuals, see EDUCATION; SOCIALISM; INDIVIDUALISM.)

¹ Includes miles of wire operated by Western Union Telegraph Company outside of the U. S., but does not include 16,677 nautical miles of cable operated by submarine cable systems.

WAGES IN THE U. S.

Telegraph, 1902.—Of the total amount paid to salaried officials, clerks, etc., \$230,250, or 19.8 per cent, was paid to corporation officers; \$255,740, or 22 per cent, to general officers; and \$676,642, or 58.2 per cent, to all other employees in general offices.

In addition there were employed, on an average, during the year 26,798 wage-earners, to whom \$13,877,041 was paid in wages.

| | |
|---|-------------|
| Managers and assistants: Average number..... | 5,752 |
| Wages..... | \$2,898,588 |
| Operators: Average number..... | 13,093 |
| Wages..... | \$8,862,349 |
| Male: Average number..... | 10,179 |
| Wages..... | \$7,494,909 |
| Female: Average number..... | 2,914 |
| Wages..... | \$1,367,440 |
| Inspectors: Average number..... | 1,152 |
| Wages..... | \$573,369 |
| Linemen: Average number..... | 1,208 |
| Wages..... | \$573,088 |
| Messengers: Average number..... | 4,746 |
| Wages..... | \$839,360 |
| All other wage-earners: Average number..... | 847 |
| Wages..... | \$130,287 |

Telephones.—Of the operators no fewer than 37,333 were women and only 2,525 were men, the

former receiving \$10,035,432 in wages and the latter \$729,666. Women operators in the exchanges constituted more than half the total average number of wage-earners in the whole industry. The moderate rate of their pay can be inferred from the total sum credited to them as wages. A slight difference as to income is shown in favor of men operators, but this might well be due to the fact that in many exchanges the night-work, justifying a higher rate, is performed by the men.

Many exchanges provide rest rooms, sell cheap lunches, and introduce various benefit features for the operatives.

II. Telegraph

For a discussion of the principles of public ownership pro and con, see PUBLIC OWNERSHIP.

As early as 1727 Stephen Gray, a pensioner of the Charter House in London, made an electric discharge pass over a circuit of some 700 feet. In 1747 Professor Watson constructed a telegraph line for the Royal Society of London that passed over the housetops and used the earth for the return circuit. In 1748 Benjamin Franklin sent crude electric signals across

the Schuylkill River at Philadelphia. In 1774 a working telegraph line was established in Geneva, Switzerland, by Le Sage. Various other experiments followed, but in 1837 Wheatstone and Cooke, in England, put a crude telegraph system into actual service in 1838 on the line of the London & Blackwall Railway, one of the first of England's steam-railroads.

Simultaneously Morse, in America, in 1837, made a public exhibition of apparatus whose conception dated back to 1835.

His fame rests, however, upon his electro-magnetic telegraph, and, while his share in this and even his originality has been bitterly contested, it seems impossible to deny that from Morse sprang the original conception

History

and that by him much of the original work was done. Morse attempted to secure aid from Congress for the construction of a line about forty miles in length between Washington and Baltimore, and finally a bill was passed by a small majority appropriating \$30,000 for this purpose. The line was duly constructed, and on May 24, 1844, Miss Ellsworth, daughter of the U. S. Commissioner of Patents, sent over it the memorable message, "What hath God wrought!"

It was not at once a financial success, and Congress yielded to the persuasions of those who wished to buy the telegraph for a private institution. Even at first, however, a few clear-sighted statesmen saw into the future far enough to discern the vast importance of the new idea and the greatness of the mistake that was being made. As early as 1844 Henry Clay was advocating government ownership of the telegraph. He wrote:

"It is quite manifest it is destined to exert great influence on the business affairs of society. In the hands of private individuals they will be able to monopolize intelligence and perform the greatest operations in commerce and other departments of business. I think such an engine should be exclusively under the control of the government."

The government declined, however, to purchase the Morse telegraph for \$100,000, and the telegraph reverted to private hands.

In 1856 the Western Union Telegraph Company consolidated a large part of the telegraphic systems of the country.

The attempts to transmit signals commercially through wires laid under water date back as far as 1839. In the summer of 1842 Morse laid an insulated wire in New York harbor. The first submarine cable of any length was laid in 1847 from Dover, England, to Calais, France.

Morse said with regard to data obtained from his own trials: "Telegraphic communication on the electro-magnetic plan may certainly be established across the Atlantic Ocean. Startling as this may now seem, I am confident the time will come when the project will be realized." The successful carrying out of the idea was in great measure due to the courage and indomitable perseverance of Cyrus W. Field. Capital was pledged, government support was enlisted, and in 1858 the first Atlantic cable was laid between Ireland and Newfoundland. Congratulatory messages were exchanged between Queen Victoria and the President of the U. S.

Since 1866 the history of submarine telegraphy has been one of continuous advance. The last definite figures with regard to cables give the number as 1,750, with an aggregate length of nearly 200,000 miles, their cost being estimated at \$275,000,000 and the number of messages transmitted annually over them at more than 6,000,000.

Wireless telegraphy, after numerous experiments and inventions by Edison and others, was finally worked out by G. Marconi in his system, patents for which were applied for in June, 1896. In 1899 he established wireless communication between England and France, and Dec. 12, 1901, across the ocean from Cornwall, England, to Newfoundland. By 1903 "Marconis" were sent to and from Atlantic steamers and elsewhere, and in 1907 a commercial transatlantic wireless telegraph service was announced.

The U. S. to-day is the only great country in the world not having a national ownership of the telegraph. France, Germany, Switzerland, Denmark, Sweden, Norway, and many other nations early recognized this truth, and built public telegraph lines at the start. England, Belgium, New Zealand, and a few other States tried private control, but found it so objectionable that they changed to public ownership. In England the telegraph was in private hands for more than a quarter of a century;

Nationalisation of

but complaints of high charges, inefficient service, unjust discrimination, etc., became so frequent and so urgent that at last the government appointed a committee to investigate the public systems of Europe. The report made an exhaustive comparison of the public system in use on the Continent with the private system of England, and

the result was so overwhelmingly in favor of the former, that the government, under the leadership of Gladstone, yielded to the demands of the reformers, headed by the Edinburgh Chamber of Commerce, and passed a law (1868) providing for the purchase of the lines, the rapid extension of the service into the rural districts, which had been neglected by the private companies, and the union of the telegraph with the postal department. The charges were at once reduced from one third to one half, and the business doubled in about two years. Complaints were no longer heard as before the transfer, and now, after more than a quarter of a century, the public system is unanimously pronounced a success. The government has raised the wages of employees from time to time, lowered rates, extended the lines, and improved the facilities. The system has paid all operating expenses and cost of extension and improvements, but the surplus beyond these items has not been quite sufficient to cover interest on the tremendous original outlay, which was about four times the real value of the lines. (See POSTAL SERVICE.)

On a thorough study of the history of private and public telegraphs in Great Britain we find that a few thoughtful men called attention to the existing abuses and advocated national ownership as the remedy; the immediate results of this were:

1. A reduction in rates of one third to one half.
2. A vast increase of business, the work done by the telegraph nearly doubling in the first year after the transfer.
3. A great extension of lines into the less populous districts, so as to give the whole people the benefit of telegraphic communication.
4. Large additional facilities by opening more offices, locating offices more conveniently, and making every post-office and post-box a place where a telegram may be deposited to be taken to the nearest telegraph office for transmission.
5. A considerable economy by uniting the telegraph service with the mail service under a single control, avoiding useless duplications, using the same offices, the same collecting and delivery agencies, and often the same operatives for both services.
6. A marked improvement in the service, throwing complaint out of the steady occupation she had so long, the aim of the post-office being service, not dividends.
7. A decided gain to employees in pay, hours, tenure of office, etc.
8. Unprecedented advantages to the press for cheap and rapid transmission of news, at the same time freeing it from the pressure of a power that claimed the right to dictate the views and opinions it should express.
9. The development of business and strengthening of social ties, ties of kinship and friendship, through the growth of business and social correspondence.
10. The removal of a great antagonism and the cessation of the vexatious and costly conflict it had caused between the companies and the people.

Looking at the subsequent history of the English postal telegraph we find:

1. A further reduction of nearly one half in the average cost of a message.
2. More than a tenfold increase of business in twenty-five years, while population increased but one fourth, over 1,000 per cent telegraph growth to 25 per cent population increase.
3. A sixfold extension of lines and fiftyfold increase of facilities.
4. A steady policy of expanding and improving the service, adopting new inventions, putting under ground hundreds of miles of wire that formerly ran over houses and streets, etc.
5. A systematic effort to elevate labor, resulting in a progressive amelioration of the condition of employees in respect to wages, hours, tenure, promotion, privileges, and perquisites.
6. A good profit to the government (excluding interest on the waterlogged capital cost) in spite of low rates, large extensions into thinly populated areas, advancing wages, heavy losses through carrying press dispatches below cost, competition of telephone companies in the best-paying part of the traffic, etc.
7. Satisfaction with the telegraph service even on the part of conservatives who objected to the change before it was made.

Comparing the English situation with our own, we find:

IN ENGLAND

Low rates.
Good service.
Extension of telegraph facilities to the masses.
Rapid growth, forty times as rapid as the growth of population, and four times as fast as the growth of the letter mail.
Progressive improvement of labor.
Harmonious uninterrupted operation.
Large popular use of the telegraph.
A management aiming solely at serving the people.
Moderate salaries for leading officials.
No big fortunes from telegraph manipulation.
Universal satisfaction with the telegraph situation.
Public monopoly.

IN THE UNITED STATES

High rates (twice as high).
Poor service.
Facilities only for the classes.
Slow growth, less than one sixth of the growth of the English system.
Progressive maltreatment of labor.
Big strikes.
The telegraph an adjunct of speculation.
A management aiming solely at serving themselves.
Exorbitant salaries for leading officials.
The telegraph a millionaire machine.
Universal discontent with the telegraph situation.
Private monopoly.

In the U. S. petitions for a postal telegraph, signed by over 2,000,000 citizens, have been presented to Congress. Organized labor, the organized farmers, chambers of commerce, and other important business organizations, have passed resolutions in its favor. But thus far the interests of the telegraph companies and their owners appear to have more weight with Congress than the interests of the people.

The real reason why the U. S. Government has not adopted the postal telegraph is undoubtedly shown by the following quotations from Postmaster-General Wanamaker's argument before the Congressional Post-office and Post-roads Committee in 1890:

In the present discussion Mr. F. B. Thurber, of New York, has given a list of the directors of the Western Union Telegraph Company. I beg to append their names: Norvin Green, Thomas T. Eckert, John J. Terry, John Vanhorne, Jay Gould, Russell Sage, Alonzo B. Cornell, Sidney Dillon, Samuel Sloan, Robert C. Clowry, George J. Gould, Edwin Gould, John G. Moore, Cyrus W. Field, Henry Weaver, Percy R. Pyne, Charles Lanier, Austin Corbin, J. Pierpont Morgan, Frederick L. Ames, John Hay, William D. Bishop, Collis P. Huntington, George B. Roberts, Sydney Shepard, Erastus Wiman, William W. Astor, Chauncey M. Depew, James W. Clendenin, Henry M. Flagler.

Mr. Thurber used this list of names to answer the question why the public cannot have the great boon of a postal telegraph. "No such list of names," he added, can be found in the directory of any other corporation in this country. Every name represents some great interest. They are the richest and the best in the financial world. They deservedly rank as our best citizens; their names are found scattered throughout the religious and charitable world, but in the matter of transmitting intelligence their interest diverges from that of the general public, and it remains to be seen whether 65,000,000 people or the comparatively few stockholders which these men represent will be able to control the great force of electricity as applied to the transmission of intelligence."

According to uncontroverted statements made before your honorable committee, the capital stock of the Western Union Telegraph Company in 1858 was \$358,700. The stock dividends declared between 1858 and 1866 amounted to \$17,810.146, and the stock issued for new lines was \$1,937,950; so that the capital stock on July 1, 1866, was \$20,133,500. In 1866 new stock was created to the amount of \$20,450,500; so that the total capital of the Western Union on July 1, 1867, was \$40,584,000. The largest dividend declared by the company up to 1874 was 4 1/2 per cent. The largest amount of stock ever divided at one time was \$10,000,000, and for a period of seven years the dividends were about 100 per cent a year on its average capital. It was by adding dividends to dividends and by piling the one up on top of the other that this tremendous amount of \$46,000,000 of capital and debt was created.

"A public telegraph will paternalize the government," say the defenders of monopoly. If so, it is pretty badly paternalized now, with the post-office, the fish commission, the treasury, customs, navy, army, agricultural, judiciary, signal service, and all the other departments; but the people do not seem to desire to give up such paternalization—they appear to enjoy it. In truth, however, public service is not paternalism, but fraternalism.

"It will cost too much." It need not cost the people \$1 of taxes to establish the postal telegraph. Plenty of capitalists are ready to build the lines for the government, introduce low rates, and agree to turn the plant over to the nation for actual value at the end of fifteen or twenty years, or allow the service to pay for the plant gradually.

The Western Union does not do and never has done one half the business its lines would carry. The total increase under public management would probably be from twenty to one hundred-fold the present business. The development of business consequent upon low rates and the extension of lines results from the use of the telegraph by a larger number of people. The wealthy people of the cities use it now all they wish to; they would use it little if any more with a five-cent rate than with a rate of twenty-five cents. But to the poor and to people in moderate circumstances, the difference between the telegraph and postal rates is practically prohibitive except under the stress of very special need. President Green of the Western Union said that 46 per cent of their business is speculative, 34 per cent legitimate trade (his own words), 12 per cent press, and 8 per cent social (Bingham Hearings, 1890, p. 56). In Sen. Rep. 577, part ii., p. 15, the then president of the Western Union said the company's social business was 5 or 6 per cent of the whole. In Belgium the social messages constitute 55 to 63 per cent of the whole.

The following table gives an idea of the difference in the charges under private ownership in the U. S. and under public ownership abroad:

| | Ordinary rate per word | Ordinary minimum charge per message | Average receipt per message |
|--------------------|------------------------|-------------------------------------|-----------------------------|
| | Cents | Cents | Cents |
| Great Britain..... | 1 | 12 | 15 1/2 |
| France..... | 1 | 10 | 15 1/2 |
| Germany..... | 1 1/2 | 12 | ... |
| Belgium..... | 1 1/2 | 12 | 8 1/2 |
| Switzerland..... | 3 | 12 | ... |
| Austria..... | 1 | 11 | ... |
| United States..... | 5 to 7 | 25 | 31 |

Since this table was compiled there has been some slight lowering of average charges abroad, and a very considerable increase in Western Union rates on many routes.

The charges in the U. S. are more than double the rates of the public telegraphs, and more than double what they need to be here. Postmaster-General Wanamaker after a careful investigation concluded that a uniform ten-cent charge for a ten-word message would be sufficient. And if Delany's methods of automatic transmission were utilized it is probable that ten cents for fifty words, and perhaps even five cents for fifty words, would prove remunerative in spite of the competition of the wireless system and the telephone.

The service rendered by our telegraph system is inferior to that afforded by the public systems of Great Britain, Germany, and Switzerland.

LONG-DISTANCE RATES IN THE UNITED STATES, CANADA, AND EUROPEAN COUNTRIES

¹ Half rate at night, 6 P. M. to 6 A. M.² Double period allowed for day rate at night.² Local rate covers free intercommunication between all points.

The treatment of labor by our telegraph system is one of the most objectionable features of the management. According to the testimony of telegraph employees in various investigations and congressional hearings, a systematic policy of reducing wages has been pursued by the telegraph monopoly. They have put boys to work in the offices to learn the business, and then if the operator resigned or moved away or did not prove satisfactory, or if for any other reason his office became vacant, they would offer the place to this young student or apprentice at \$5 or \$10 less than the salary formerly paid; and in that way and in other ways they have reduced the wage so that, according to the testimony, it was reduced 40 per cent from 1870 to 1883.

The great strike of 1883 throughout our telegraph system was largely due to the low wages and long hours. They asked for an increase of pay of 15 per cent and for eight-hour work, and no salary lower than \$50. These requests, moderate as they were, were refused, and the great strike was fought out at a cost altogether of over \$1,000,000, and after the strike, according to Western Union testimony, the result was that the company was able to get about one third more work out of the men for the same pay. The hours of operators are in many cases very long, the work is very trying, and they are apt to be affected by consumption and other diseases—unable to continue many years under the strain.

They also blacklist their employees, I understand from the workers, so that the man who meets with their disapproval is practically unable to get employment in the country. They try to shut out the unions of the men, and they even deny them the privilege of petition. The men say that the leaders in presenting a joint request for amelioration of conditions, if found out, are almost sure to be discharged from employment.

As I write (Oct., 1907) the telegraph services are tied up and obstructed by another great strike from one end of the country to the other. The public systems treat their employees fairly and are not troubled with strikes.

The Western Union has sinned grievously in the line of overcapitalization; putting about a hundred millions of stocks in a plant that has been es-

timated to be worth only five or ten millions more than the bonds, and into which the stockholders, according to the reports of congressional investigations, did not probably put more than sixteen millions all told.

The Telegraph Trust goes into politics. It has distributed favors among various legislators and among congressmen, and Western Union testimony is explicit as to the benefits they have received. Long ago the president of the Western Union said:

"The franks issued to government officials constitute nearly a third of the total complimentary business. The wires of the Western Union Company extend into thirty-seven states and nine territories within the limits of the U. S., and into four of the British provinces. In all of them our property is more or less subject to the action of the national, state, and municipal authorities, and the judicious use of complimentary franks among them has been the means of saving to the company many times the money value of the free service performed." (Western Union Report of 1873. See also Wanamaker's argument, p. 164; Postmaster-General Creswell's Report, 1873, p. 49.)

The passage is constantly cited by writers and speakers dealing with the telegraph, because of its astonishing nature and implications. I have it on the authority of one of the most distinguished members of the U. S. Senate that "books of telegraph franks are tendered to every senator and member of Congress, and most of them accept the favor."

III. Telephone

For the principles of public ownership pro and con, see PUBLIC OWNERSHIP.

The history of the telephone, like that of the telegraph, is full of conflicting claims as to priority of discovery. Page, Boursoul, Professor Clifton, and, above all, Reis in Germany, made important discoveries. But it is beyond dispute that March 7, 1876, when Alexander Graham Bell patented his invention of a speaking telephone, there was not a single operative telephone in the hands of the public anywhere in the world.

The first line ever built for telephone purposes was in Boston, 1877. The Bell Telephone Association was formed that year and the New England Telephone Company in Feb., 1878, and the Bell Telephone Company in July, 1878. In 1879 these combined into the National Bell Telephone Company, and the American Bell Telephone Company was formed in 1880, ab-

sorbed in 1899 in the American Telegraph and Telephone Company.

The telephone was immediately introduced into Europe after America, and more slowly in other parts of the world. But while in the U. S. its development has remained exclusively in private hands, in Europe the telephone and telegraph lines have remained almost exclusively subject to government control. In only two foreign countries—Great Britain and Sweden—has there been any notable exception to this rule, and the British Government has completed with the National Telephone Company, which has controlled the Bell telephone system for many years, negotiations by which the Postal Telegraph service will take over the entire telephone lines of Great Britain.

Public Ownership

ANNUAL TELEPHONE RATES—DIRECT UNLIMITED SERVICE

| COUNTRY | Place and rate |
|---------------|---|
| Austria* | \$40 Vienna 20 smaller cities |
| Belgium* | 48 Brussels 33 smaller cities |
| France* | 80 Paris 40 smaller places |
| Great Britain | 115 to \$100 |
| Germany* | 45 Berlin 15 smaller places, 1,000 telephones 18 1,000 to 5,000 telephones 22 5,000 to 20,000 telephones 24 in places having over 20,000 telephones |
| Holland* | 14 to \$46 |
| Italy | 12 to 40 |
| Norway* | 8 to 21 |
| Sweden* | 6 to 26 |
| Switzerland* | 19.4 first year } plus 1 cent 13.6 second year } per message 7.8 third year } |
| United States | 15 to \$240 |

The countries marked with a star have public or cooperative systems wholly or in large part.

The best telephoned countries in the world, that is, the countries having the most telephones per 1,000 population, are Sweden, Norway, and Switzerland, where the telephones are most under public management. When the government entered the telephone field in Stockholm, it greatly reduced the rates and improved the service. The same thing was true when Amsterdam and Rotterdam adopted municipal ownership and operation of the telephone service.

When Glasgow put in a municipal telephone system, she cut the annual rate from \$50 to \$26.

The following table shows the Bell Telephone charges in a number of American cities and also the charges made by the independent companies which in many cities have cut the Bell rate in two:

| | Business telephone | | Residence telephone | |
|--------------|--------------------|------|---------------------|------|
| | Bell | Ind. | Bell | Ind. |
| Philadelphia | 160 | 80 | 130 | 48 |
| St. Louis | 120 | 60 | 160 | 36 |
| Indianapolis | 72 | 40 | 48 | 24 |
| Cleveland | 84 | 48 | 60 | 36 |
| Baltimore | 125 | 48 | 100 | 36 |
| Rochester | 125 | 48 | 64 | 36 |

1 Four-party line measured service, Bell, St. Louis.

Our excessive telephone rates constitute a tax on business and social intercourse, a limitation on the development of civilization, intelligence, friendship, affection, and industry.

FRANK PARSONS.

TEMPERANCE (see also CENTRAL PUBLIC HOUSE TRUST ASSOCIATION; DISPENSARY SYSTEM; HIGH LICENSE; INTemperance; LIQUOR TRAFFIC; NATIONALIZATION OF THE LIQUOR TRAFFIC; NORWEGIAN COMPANY SYSTEM; PROHIBITION; PROHIBITION PARTY; POVERTY; WOMAN'S CHRISTIAN TEMPERANCE UNION): We give in this article a brief sketch of the temperance movement, referring the reader to the above articles for details.

The temperance movement is a modern movement the intemperance is as old as history. We find instances of intoxication in Genesis, the oldest Hebrew writing, and in Homer's pictures of early Greek social life. Intoxication is described or referred to in the ancient books of China, the "Vedas" of India, the "Avestas" of Persia, and in all early traditions. The fiery "rice wines" of India and China watched the drugged wines of Greece and Rome. Fermentation was usually the early source of intoxicating drinks; distillation has been known in Europe at least for only six centuries. Spirit drinking is said to have developed first in northern climes, and perhaps in England. There were, however, some early attempts at temperance reform. The Chinese claim that eleven centuries before Christ some of their emperors made strenuous temperance reforms, one going so far as to order all vines in the kingdom to be uprooted. In India and Persia the priesthood early made some attempts at reform, and the Buddhists taught total abstinence. Buddhist sects seem to have spread total abstinence ideas far and wide, and among the Hebrews there were various total abstinence orders and sects, such as the Nazarites and Rechabites in olden times, and the Essenes and Therapeutae of the time of Christ. Draco is said to have punished drunkenness with death, and Lycurgus, King of Thrace, to have ordered all vines to be destroyed, as did later Terbalus, a Bulgarian prince. The Carthaginians forbade wine in the camps and among magistrates holding public office. In northern climes the use of intoxicating beverages was universal. The Saxons were mighty eaters and drinkers. The mead horn plays a large part in all Saxon literature. Mead or metheglin they made from honey, beer from barley. Weddings, christenings, and funerals were scenes of intoxication, sometimes of orgies. The burial clubs (see GILDS) were drinking-clubs. The Church strove somewhat for reform, perhaps because the clergy needed it. St. Gildas the Wise in 570 A.D. ordered the drunken clergy to be punished. St. David (569) punished also the publican. King Edgar, at the instance of Dunstan, limited by law the number of taverns and the size of the pots. By a law of 1285 taverns in London were to close at curfew. This was to prevent crime. Yet drinking increased. When George Neville was made Archbishop of York, in 1464, we are told that 300 tuns of ale and 100 of wine were consumed. Bacon saw that "all the crimes on earth do not destroy so many of the human race nor alienate so much property as drunkenness." Beginning with 1603, legislation against alehouses and drunkenness is very frequent, but accomplished nothing. According to Bishop Earle, the public house was the rendezvous for all classes. All or almost all the clergy drank. Decker says that in 1632 a whole street was in some places but a continuous ale-house, not a shop to be seen between red lattice and red lattice. The Puritans were about as bad. Pepys says Monk's troops were most of them drunk all day. Even the women drank. Lecky says that in 1688, 12,400,000 barrels of beer were brewed for a population of a little over 5,000,000, or about ninety gallons a head, against about twenty-nine at present in England. In the eighteenth century gin-drinking increased. Retailers hung out signs saying "Drunk for 1d. Dead drunk for 2d. Straw for nothing." Eleven million gallons of gin were consumed in England in 1733; nearly 20,000,000 in 1742. In 1749 there were 17,000 gin-shops within the bills of mortality. Crime and immorality rose. In 1736 Parliament tried to suppress gin-drinking by putting a prohibitory tax on it, but the illicit trade was so great that it soon went to the other extreme, and made the trade well-nigh free. But this did no good. In 1751 distillers were forbidden to sell to unlicensed publicans, and tipping debts could not be collected by law. According to Lecky, this did some good. Gin began to give way to beer, a vast improvement.

Early Ages

The temperance movement is a modern movement the intemperance is as old as history. We find instances of intoxication in Genesis, the oldest Hebrew writing, and in Homer's pictures of early Greek social life. Intoxication is described or referred to in the ancient books of China, the "Vedas" of India, the "Avestas" of Persia, and in all early traditions. The fiery "rice wines" of India and China watched the drugged wines of Greece and Rome. Fermentation was usually the early source of intoxicating drinks; distillation has been known in Europe at least for only six centuries. Spirit drinking is said to have developed first in northern climes, and perhaps in England. There were, however, some early attempts at temperance reform. The Chinese claim that eleven centuries before Christ some of their emperors made strenuous temperance reforms, one going so far as to order all vines in the kingdom to be uprooted. In India and Persia the priesthood early made some attempts at reform, and the Buddhists taught total abstinence. Buddhist sects seem to have spread total abstinence ideas far and wide, and among the Hebrews there were various total abstinence orders and sects, such as the Nazarites and Rechabites in olden times, and the Essenes and Therapeutae of the time of Christ. Draco is said to have punished drunkenness with death, and Lycurgus, King of Thrace, to have ordered all vines to be destroyed, as did later Terbalus, a Bulgarian prince. The Carthaginians forbade wine in the camps and among magistrates holding public office. In northern climes the use of intoxicating beverages was universal. The Saxons were mighty eaters and drinkers. The mead horn plays a large part in all Saxon literature. Mead or metheglin they made from honey, beer from barley. Weddings, christenings, and funerals were scenes of intoxication, sometimes of orgies. The burial clubs (see GILDS) were drinking-clubs. The Church strove somewhat for reform, perhaps because the clergy needed it. St. Gildas the Wise in 570 A.D. ordered the drunken clergy to be punished. St. David (569) punished also the publican. King Edgar, at the instance of Dunstan, limited by law the number of taverns and the size of the pots. By a law of 1285 taverns in London were to close at curfew. This was to prevent crime. Yet drinking increased. When George Neville was made Archbishop of York, in 1464, we are told that 300 tuns of ale and 100 of wine were consumed. Bacon saw that "all the crimes on earth do not destroy so many of the human race nor alienate so much property as drunkenness." Beginning with 1603, legislation against alehouses and drunkenness is very frequent, but accomplished nothing. According to Bishop Earle, the public house was the rendezvous for all classes. All or almost all the clergy drank. Decker says that in 1632 a whole street was in some places but a continuous ale-house, not a shop to be seen between red lattice and red lattice. The Puritans were about as bad. Pepys says Monk's troops were most of them drunk all day. Even the women drank. Lecky says that in 1688, 12,400,000 barrels of beer were brewed for a population of a little over 5,000,000, or about ninety gallons a head, against about twenty-nine at present in England. In the eighteenth century gin-drinking increased. Retailers hung out signs saying "Drunk for 1d. Dead drunk for 2d. Straw for nothing." Eleven million gallons of gin were consumed in England in 1733; nearly 20,000,000 in 1742. In 1749 there were 17,000 gin-shops within the bills of mortality. Crime and immorality rose. In 1736 Parliament tried to suppress gin-drinking by putting a prohibitory tax on it, but the illicit trade was so great that it soon went to the other extreme, and made the trade well-nigh free. But this did no good. In 1751 distillers were forbidden to sell to unlicensed publicans, and tipping debts could not be collected by law. According to Lecky, this did some good. Gin began to give way to beer, a vast improvement.

Eighteenth Century

In the American colonies the evil was as bad. Dr. Dorchester ("Problems of Religious Progress") tells us that in 1790 two gallons and a half of distilled spirits and wine were consumed per capita; in 1810 four and a half; in 1823, seven and a half of spirits alone. At a later date there were 400,000 confirmed drunkards, while everybody drank a little, and often to excess. The rich drank French and Spanish brandy; the middle classes, Jamaica rum; the poor, New England rum. Drunkenness was not uncommon among the clergy, and an ordination was often little short of a debauch. Rum was a requisite of every gathering. All public men drank (See also CRIME.)

In the American colonies the evil was as bad. Dr. Dorchester ("Problems of Religious Progress") tells us that in 1790 two gallons and a half of distilled spirits and wine were consumed per capita; in 1810 four and a half; in 1823, seven and a half of spirits alone. At a later date there were 400,000 confirmed drunkards, while everybody drank a little, and often to excess. The rich drank French and Spanish brandy; the middle classes, Jamaica rum; the poor, New England rum. Drunkenness was not uncommon among the clergy, and an ordination was often little short of a debauch. Rum was a requisite of every gathering. All public men drank (See also CRIME.)

The modern temperance movement began in the first quarter of this century, in England first, tho it first gained headway in the United States. In 1800 Micajah Pendleton, of Nelson County, Va., signed and circulated a total abstinence pledge. In 1804 Dr. Benjamin Rush (*q. v.*), of Philadelphia, wrote an important temperance paper, and in 1805 Dr. Ebenezer Porter, of Connecticut, preached an important sermon. In 1808 Dr. J. B. Clark founded, in Saratoga County, N. Y., the Temperance Society of Moreau and Northumberland. In 1813 the Massachusetts Society for the Suppression of Intemperance was formed. In 1826 the American Society for the Promotion of Temperance was founded in Boston, based upon total abstinence, the Rev. Mr.

Hewitt being the first general agent. By 1829 there were eleven state and about 1,000 local societies. The same year six sermons by Lyman Beecher, of Litchfield, Conn., produced a wide effect. In 1833 there were 6,000 local societies and over 1,000,000 members; 2,000 distilleries had been stopt. Most of this early temperance movement, however, was opposed simply to the use of distilled spirits, and the pledge in general use had reference to these alone. Cider, beer, and wine were generally considered harmless or indispensable. Total abstinence from all intoxicating liquors was embodied in Pendleton's pledge of 1800 and in the New York society of 1809 and in a few other local societies, but was voted down by the general society in 1833. In 1836, however, at the meeting in Saratoga it was finally adopted, and the American Temperance Society has since been committed to total abstinence. In 1840 began the great but brief Washingtonian movement, when six intemperate drinkers in Baltimore, Md., met one Friday evening, at their usual resort, and suddenly resolved to reform. They drew up a pledge, signed it on the spot, calling themselves the Washingtonian Society. They began to hold public meetings, and met with great success. Crowds attended, and thousands took the pledge. Many became speakers, and Washingtonian societies were organized everywhere. In four or five years it is estimated that 150,000 drunkards and 500,000 others signed the pledge. The movement, however, did not endure. The toper's motley became the sensational talk of speakers, and ignorant and sometimes evil men, caring only for notoriety or pay, ruined the movement. In 1842 the Order of the Sons of Temperance was founded in the city of New York, the first society modeled after Masonic ideas. In 1845 the Order of the Templars of Honor and Temperance and in 1851 the Order of Good Templars (*q. v.*) were formed. In 1845 a law in New York State prohibiting the public sale of alcoholic liquor was passed and referred to the people, and received a large majority, but in 1847 it was repealed. In 1851 the Maine law (*q. v.*) was passed. (For temperance legislation since that date, see PROHIBITION; HIGH LICENSE; LOCAL OPTION.)

In 1869 the Woman's Christian Temperance Union commenced its important and successful movement, and marks an epoch in the temperance movement of the world. Since that date its efforts for temperance education in the public schools, churches, and to a less extent in legislation, play a very large part in the temperance movement of this country and the world.

(But for this, see special article, WOMAN'S CHRISTIAN TEMPERANCE UNION.)

The temperance movement in America has moved largely along denominational and religious lines. Nearly all of the Protestant denominations have formed temperance societies within their own borders. The "Congregational Total Abstinence Association" dates from 1874; that of the Baptists from 1874; those of the various Methodist bodies from about the same time. Owing to the fact that most of these and other denominations, e. g., the Quakers, Dunkards, make total abstinence a test of membership, temperance has received a religious sanction. Among the lower classes this work has been done chiefly by the Salvation Army, whose aim seems to be to save people from drink; that is, from poverty and sin. The purpose of the Church Temperance Society (*q. v.*) is not so much abstinence as temperance; altho the former is distinctly encouraged. It was organized in 1881, and has a Woman's Auxiliary and a "Legion" for young men. It endeavors to have the Sunday before Advent observed as a "Temperance Sunday" in the local churches, and publishes a monthly, *Temperance*. The Roman Catholic Church, too, insists on moderation, and recommends abstinence where the former is difficult. The "Catholic Total Abstinence Union," formed in Baltimore in 1872, numbered about 80,000 members in 1902.

The Prohibition Party (*q. v.*), first organized in 1869, assumed great importance in the national campaign of 1884, and since then has energetically called attention to legislation on the liquor question, and particularly local prohibition, forcing a vote on the subject wherever possible, with the result of very numerous victories and an incalculable amount of educational discussion and consideration. (But see articles PROHIBITION; PROHIBITION PARTY; LOCAL PROHIBITION.)

In 1893, in Ohio, the Anti-Saloon League of that state was founded which has now grown into an important national movement, organized in forty-three states and territories, and doing in many states, e. g., Ohio and New York, a very active non-partizan work, rousing, however, the churches and religious bodies into organized influence upon legislatures, so at times, as in Ohio, to affect the politics of the whole state. (See ANTI-SALOON LEAGUE; see also the LINCOLN LEAGUE, organized in connection with it. See also BANDS OF HOPE.)

The World's Temperance Congress of Chicago in 1893 was attended by delegates from every civilized country, and discuss the problem from every point of view, particularly the economic. At the International Congress against Alcoholism (Stockholm, July 28 to August 3, 1907) the statement was made by an American delegate to the effect that over "30,000,000 people in the U. S. were living under the operation of prohibitory laws, through local option." The actual number is about 33,000,000.

A remarkable movement toward prohibition and local option has commenced (1907) in the Southern states. The Georgia legislature passed a state prohibition law Aug. 2d, which was promptly signed by Governor Hoke Smith, and is to take effect Jan. 1, 1908. The measure has the backing of the people, because under the "local option clause" county after county had voted "no license," until the number had reached 125, and only 21 were left with licenses. Other states are moving in the same direction. Ten-

Modern Movements

nessee has local option in all but a few counties. North Carolina has 60 out of 90 counties with "no license"; Alabama over 50 out of 66; Kentucky 87 out of 119; Texas 152 out of 230; South Carolina all over the state with the exception of 10 cities. All these states are tending toward prohibition. The territory of Oklahoma, before adopting the constitution for statehood, had a plebiscite on Aug. 6th on the question of prohibition, and adopted (Sept. 17, 1907) the constitution, containing a prohibition clause by about 30,000 majority. In the Southern states 17,000,000 out of 27,000,000 people are already under local option. (See LOCAL PROHIBITION.)

The fight about the canteens in the U. S. army posts still continues. The advocates of the canteen claim that drunkenness has increased since 1901, when it was abolished. The Prohibitionists claim that arrests for drunkenness have largely decreased, and claim to base their contention on official figures, which the officials say do not show this because of a change in laws.

The Anti-Saloon League (*q. v.*) is a most progressive society, and has a large and efficient organization. Owing to the strenuous exertions of the larger temperance societies, instruction on the influence of alcohol on the mind and body is now given in nearly all public schools all over the U. S., in connection with physiology. This instruction is graded to suit the different ages and comprehension of the children.

The Prohibitionists are now trying to prevail upon the national government not to issue receipts to wholesale dealers or other persons who sell liquor in bottles and larger quantities, because, e. g., Maine with no state licenses had (1905) 640 of these U. S. Treasury receipts, and thus there is a possibility of the state law being circumvented.

The latest move of general importance is the creation of a new society, the "Youths' Temperance Alliance of America," by the National Temperance Society, in 1907. It is to be chiefly an educational agency for the young people of both sexes, preparing platform speakers and serving as a sort of clearing-house for the various temperance movements, particularly among the young people. That the liquor interests are alarmed is evidenced by a number of articles in their papers, urging unity and a strong fight all along the line; also calling attention to the fact that none of the older prohibition states have abolished the law and that in all of them the sale of intoxicants has decreased.

An interesting temperance feature is the exposure of quack and patent medicines by a prominent weekly during 1906, as containing from 40 to 80 per cent alcohol, and greatly reducing the sale of these nostrums among farmers and villagers.

Another feature tending toward abstinence is the demand of an increasing number of employers for teetotalism on the part of their employees, e. g., of the Pennsylvania Railroad Company.

GREAT BRITAIN

In Great Britain Dr. Trotter, of Edinburgh, published a book on the effects of intemperance in 1809. The first temperance society was organized in Skibbereen, in Ireland, in 1818. The first society based on total abstinence was formed at New Ross, Ireland, by the Rev. George Cane in 1829, tho the same year one was formed in Glasgow, Scotland. Within a year there were twenty-five societies in Ireland. The first society of England was formed in Yorkshire in 1830, teetotalism being still used as colloquial for total abstinence, and the

same year the London Temperance Society held its first public meeting. In 1831 the British and Foreign Temperance Society was formed, and in Dublin the Hibernia Temperance Society. In 1830 the Duke of Wellington Beer Act tried to encourage the use of beer instead of spirits. In 1834 a select committee of the House of Commons was appointed to report on the subject. Mr. Muchmore in this report describes the evils of the

Great Britain

day. Fourteen public houses were patronized by 2,750 persons each per day. They had connected with them large halls invisible from the street, where girls of the town, sailors, etc., danced. According to the census there was then one public house for every twenty families in the United Kingdom. To-day there is not one for every fifty. The spirits distilled in England rose from 43,000,000 gallons in the four years 1791-1795, to 154,000,000 in 1826-31.

In 1838 the Rev. Theobald Mathew (Father Mathew), a Roman Catholic priest in Cork, Ireland, commenced a temperance movement and in the space of five months administered the pledge to 150,000 persons in Cork alone. In Galway 100,000 took the pledge in two days. He traveled in Ireland and England, and in 1850 came to America, everywhere finding great success, and becoming known till his death, in 1856, as the Apostle of Temperance. The Father Mathew societies of the Catholic Church still attest his memory, tho much of his early work died away. From 1840 to 1850 the temperance movement languished, and in 1850 the British and Foreign Temperance Society perished of inanition. In 1853 a United Kingdom Alliance was formed in Manchester to agitate for prohibitory laws. Various ideas were introduced from the United States, and in 1868 the Order of Good Templars. The Church of England Temperance Society was formed in 1867. Total abstinence became the cry. A Workingman's Teetotal League was formed and other similar societies. In 1872 was passed the Licensing Act, the most important act of the century, tho acts have been very numerous, most of them ineffective. In 1876 the House of Lords appointed a select committee on the subject.

A number of laws have been passed intended to discourage habitual drunkenness. Under the Act of 1879 an inebriate had to apply voluntarily for admission to a retreat; the Act of 1898 made retirement to a retreat compulsory for all those who by criminal actions or by becoming public nuisances had put themselves within reach of the law. The Licensing Act of 1902 gave power to a magistrate to commit a wife, if an habitual drunkard, to a retreat. These retreats are of three kinds: (1) Certified inebriate reformatories; (2) State inebriate reformatories—for the worst cases; (3) Licensed retreats, which, under the "Inebriates' Reformation and After-Care Association's" (32 Charing Cross, S. W.) supervision, have greatly improved in late years. The "Society for the Study of Inebriety" was established in 1884. Only qualified medical practitioners are admitted as full members; medical students and other interested persons as associates (120 Harley Street, W., London). At present the Church of England Temperance Society seems to be the largest society with 609,319 members, 384,289 of these being juveniles, and of the remainder 174,637 being of the total abstinence section. According to Mr. Nelius, one person in England out of eight is a teetotaler, but Mr. Arthur Shadwell, to whose articles in the *National Review* for Dec., 1895, and April, 1896, we are much indebted for our facts, very much questions whether this is not a great exaggeration.

During recent years notable advance has been made in Great Britain along the line of sentiment in favor of Sunday closing. Scotland has had all-day Sunday closing since 1853-54; Ireland, except in the five chief towns of Dublin, Belfast, Cork, Limerick, and Waterford, since 1878; and Wales, since 1881. Up to 1839 public houses were open throughout the day and the whole of Sunday except during the hours of morning and afternoon divine service. In that year, owing to the disorderly state of many of the London streets on Sunday morning, a clause was inserted in the metropolitan police act to

close public houses from midnight on Saturday to one o'clock on Sunday afternoon. Other cities followed suit, and in 1854 Patten's bill further closed the public houses on Sunday afternoon from 2.30 to 6 o'clock, and 10 at night to 4 on Monday morning. This has been the law with slight modifications since that time. There is strong public sentiment in England for entire Sunday closing. Such sentiment is also spreading in Canada.

Lately Great Britain has debated several propositions, e. g., the Norwegian Company System. But no special legislative act has been passed. Nevertheless, the temperance movement is gaining rapidly. The sentiment against women bartenders has resulted in their removal in most cities. Licenses are not as readily granted as formerly. Indeed, Miss Agnes E. Slack stated at the International Congress Against Alcoholism (Stockholm, 1907) that England had reduced the number of licenses by 1,000 per annum for several years. The case of Liverpool is, perhaps, typical of many other cities in Great Britain. Sir Thomas Hughes has been chairman of the Liverpool Licensing Bench since 1890. Under his wise management the number of fully licensed houses has been reduced by 200 between 1890 and 1907, altho the city's population has increased by 200,000 during that time. The beneficial effect of his management is so keenly appreciated by his fellow townsmen that they have elected him Lord Mayor (1907).

On March 31, 1901, England and Wales had 66,973 publican's licenses; on the same date, 1905, only 66,239—a reduction of 734, or 1.09 per cent. Beer licenses and reductions for the same dates: 29,286; 28,522; 764, or 2.6. Beer and wine licenses: 4,968; 4,845; 123, or 2.47. Total licenses: 101,227; 99,606; 1,621, or 1.6. This reduction was made notwithstanding an increase in population of 1,531,000. The total reductions between 1881 and 1905 were 4,942; a steady decrease distributed almost evenly over the 25 years. In addition it ought to be mentioned that a large number of applications were refused, 639 in 1903 alone. In the United Kingdom the decrease in the number of licenses in 1906-7 over 1905-6 was 3,007. On the initiation of the Prohibitionists and other temperance leaders several bills have been passed by Parliament, while others have failed. Among those passed in 1905 were the following: Closing of Licensed Premises on Christmas Days in Ireland; Expiring Laws Continuation Bill; Sale of Intoxicants to Children; the Registration of Clubs Bill for Ireland (1904). The Liquor Traffic Local Veto Bill for Scotland was defeated by a small majority; it showed, however, that the Scotch are ready for local option.

The fall in the sale and consumption of alcoholic beverages may be estimated from the fact that the revenue from wine was £146,000 less in 1905 than 1904; the importation of foreign spirits showed a decline of £610,000, the excise for beer of £420,000. The total decrease in excise and customs of all alcoholic beverages fell from £39,206,781 in 1901 to £34,670,599 in 1906 in the United Kingdom. The consumption of spirits per capita in 1900 was 1.09 gallon, in 1904 only 0.95; that of beer 31.5 gallons and 29, respectively. Considerable controversy has arisen over the question of compensation to liquor dealers whose licenses are taken away.

The drink bill of England and Wales for 1904

was £140,366,542, or £4 3s. 2d. per head; Scotland, £14,804,305, or £3 4s.; Ireland, £13,816,318, or £3 2s. 10d.

The Temperance Hospital in London, established 1874, receives patients from all parts of the kingdom, and from beyond the seas; 23,393 persons were treated during the thirty-one years of its existence; its rate of mortality has been about 7.3 per cent on an average.

The "United Kingdom Alliance" has spread temperance literature broadcast wherever feasible. It is trying to raise a fund of 100,000 guineas for better carrying on its work. Its receipts in 1905 were £13,980.

There are two particularly encouraging features of the movement in Great Britain: the ever-increasing number of people both among working men and government circles who are interested in temperance. John Burns, for instance, has written a widely read pamphlet on "Labor and Drink," of which nearly 70,000 copies were distributed in 1904. The other feature is the growing tendency of the people to take their enjoyments in other forms than drinking. The habit of attending outdoor games is becoming firmly established, and means less drinking. The cheap railway fares enable people to go to the seaside and the country during their holidays; they take their own "nose-bags" along, have picnics, and spend but little money on drinks.

The growth of various temperance orders, e. g., the Sons of Temperance, the Rechabites, the British Medical Temperance Association (1872)—with a large similar association in the U. S. since 1891—are most encouraging signs; as is the enrolment of large numbers of children in Bands of Hope, etc. One of the most important modern movements, however, in England, is that of the Public House Trust. (For this, however, see CENTRAL PUBLIC HOUSE TRUST ASSOCIATION.) Many people in England are studying the Norwegian Company, and not a few favor State management of the trade.

The English colonies are moving forward steadily, partly under local option laws, partly by a closer supervision and stricter regulation of the

British Colonies

liquor traffic. This progress is a fact, notwithstanding occasional setbacks owing to prosperous times or other incalculable conditions. The liquor bill per head in New South Wales, Australia, has, under local option since 1882, steadily gone down from £5 4s. 5d. in 1881 to £3 1s. 5d. in 1906—a reduction of £2 3s. in twenty-five years. In Victoria, under local option since 1876, the reduction has been from £5 3s. 5d. in 1885 to £3 9s. 10d. in 1906.

In the Dominion of New Zealand Sunday closing is in operation throughout the colony. Publicans are forbidden to serve young people, or drunkards proclaimed by the magistrates; Maori women may not be served; and the entire King Country of the Maoris is under prohibition by legislative act of the colony. In 1881 a local option law was passed by the legislature, amended several times since, e. g., 1893 by the Liquor Sale Act; 1895 by the Liquor Sale Act Amendment Act. All men and women over twenty-one years of age have the suffrage, and each electoral district can suppress the liquor traffic by a three fifths majority vote within its own borders. Clutha voted local option in 1893, and has maintained it ever since. In 1902 five other districts took the same step; a number of other districts

just fell short of the required three fifths majority, while thirteen districts carried the vote for the reduction of the number of saloons by 25 per cent. The prohibition sentiment is growing steadily, and it may be owing to this fact that New Zealand shows the second smallest per capita consumption of absolute alcohol, 0.86 gallons, as compared with 2.04 in the United Kingdom, and 0.71 in Canada.

The Dominion of Canada is the most sober country in the English-speaking world according to statistics. The so-called Scott Act, a prohibition measure, was passed in 1878 and applies to the whole Dominion. It confers local veto power upon the various cities and counties. Separate local option laws have since been passed by nearly every province. In the more populous Eastern provinces, comprising 90 per cent of the population, sentiment is constantly growing in favor of prohibition. The Province of Quebec has had local option since 1899; New Brunswick in all but five counties and one city; Nova Scotia in sixteen out of eighteen counties; Prince Edward Island in all counties and cities; Manitoba in many towns and villages. Aside from the local option law several provinces make the obtaining of licenses difficult or impossible by requiring the indorsement of two thirds of the rate-payers. Ontario voted in favor of prohibition (1902) by a majority of 199,749 to 103,548; but fell short of the necessary three fifths vote. Nevertheless this province has progressed rapidly in temperance. Licenses in 1874 numbered 6,185; in 1902 only 2,947. The city of Toronto had 530 licenses in 1874 with 60,000 population; in 1907 with about 250,000 only 207.

On the Continent sentiment in favor of temperance and total abstinence is growing. In the Scandinavian countries, Norway and Sweden, the problem is being partially solved by the Gothenburg system, or State conduct of the liquor traffic. (For a discussion of the benefits claimed for this by its advocates and the faults charged by its opponents, see NORWEGIAN COMPANY SYSTEM.)

In France and Germany a number of medical and scientific bodies of the highest and most conservative authority have made utterances as to the evil effects of the use of intoxicating liquors. Influential periodicals in France, like the review *Science Française*, *Le Temps*, and bodies like the French Academy of Medicine and the Association for the Advancement of Science, have taken up the fight against the use of alcohol as a beverage. In Germany one of the most noteworthy utterances was the publication in the *Deutsche Versicherungs-Zeitung*, of Berlin, of a lecture by Dr. Brendel, delivered before the Anthropological Society of Munich (March 28, 1894), in which insurance companies are warned that their risks are dangerously increased by alcoholism—drink always shortening life. Similar statements have been made since with increasing frequency and authority, e. g., by Dr. Zacher, the director of the

Germany Imperial Statistical Department, in 1906. It must be borne in mind that this department had 11,418,446 people insured in the division for sickness, 18,376,000 in that of accidents, and 13,756,400 in that of old age. Statements of the director are, therefore, based both on wide observation and accurate information. Dr. Zacher says in "Social Progress" (1906), pp. 36 and 37:

The continued and detailed statistics of the working men's insurance have demonstrated that alcoholism, that is, the ex-

cessive consumption of alcoholic drinks, leads to increased exposure to sickness, accident and invalidity, consequently increasing mortality. Moreover, people addicted to alcohol readily contract diseases of all sorts, convalesce slower, and are prone to relapse, while, on the other hand, the members which abstain from such excesses are far less exposed, and their recoveries are surer and more rapid. It is certain that the abuse of alcohol tends not only to largely increase the liability to accidents and unfavorably influences their consequences, but also promotes and spreads the national disease of tuberculosis.

It is, perhaps, owing to this interest in temperance by governmental and scientific circles, that the old private temperance societies have taken on a new lease of life and new ones have been founded. Some of these societies began to agitate against brandy in 1842. Beer was considered harmless. Since the consumption of both increased, the *Verein gegen den Missbrauch geistiger Getränke* began a strong agitation in behalf of temperance in the eighties, and kept it up under the guidance and inspiration of Dr. J. Waldschmidt, its president. This society numbered 20,000 in 1906 and had an income of 45,492 marks in 1904. The Good Templars are doing splendid work in the north, particularly in Schleswig-Holstein, and the Blue Cross Society in the south. The *Centralverband zur Bekämpfung des Alkoholismus* is a total abstinence society with a small but growing membership. How badly work of this kind is needed may be inferred from the fact that in many rural districts a public house exists for less than 200 people.

Austria has a "Verein gegen Trunksucht" since 1884. Its activity has been directed chiefly along the line of instruction by means of pamphlets and lectures in different languages. Since 1893 it issues jointly with a similar society in Saxony a monthly, *Volksgesundheit*.

Austria The society has established branches in the different provinces, and aims at reaching the different nationalities. The total abstinence society of the *Slovenes*, for instance, has 250 members. The Austrian Women Abstinence Society has succeeded in establishing a temperance library in Vienna and opening a temperance restaurant in 1905. A significant feature of the movement in Austria is the high scientific character of its leaders; some of the foremost physicians, e. g., Dr. Pösch, Dr. Müller, Dr. Fröhlich, and Dr. Wlassak, of Vienna, being among them. *Hungary* has a similar society. The delegation from Austria-Hungary at the congress in Stockholm (1907) numbered 75.

The first Belgian temperance society was organized about 1850 at Brussels. In 1879 the *Association belge contre l'abus des boissons alcooliques* was founded. It took the title of *Ligue patriotique contre l'alcoolisme* in 1884. The first abstinence organization was formed in 1866 at Saint-Trond. In 1889 a society among small children and school children was formed. In 1890 the government voted an annual appropriation of 65,000 francs for controlling alcoholism. The *Ligue* had (1903) 27 branches with 3,000 members and 2,550 adherents. The branches are scattered over all parts of the kingdom among both the French and Flemish people; it has sections for women nearly in every branch. In 1905 the "Sociétés Scolaires de Tempérance" were represented in 2,318 communes, 3,208 schools, with 65,151 members in primary schools—out of a total 113,714 boys; 1,068 schools for older boys had a membership of 27,876. The total number of boys who have taken the pledge since the in-

auguration of the society is 333,657. The remarkable fact about the temperance societies among school children is their being subsidized by the communes to the extent of 3,333 francs. In a number of departments sections for girls have been formed. In 1905 they numbered 272 in primary schools, with 8,781 girls, and 37 in schools for older girls, with 1,286 members. There were, moreover, 164 sections for girls who had graduated, with 8,786 members. There are other organizations for minors—18 in all, with 672 branches and 54,967 abstinent members of fourteen years or under. They are subsidized by the government to the extent of nearly 72,000 francs.

This is certainly a creditable showing and has received much governmental support, with marked results.

TABLE SHOWING CONSUMPTION OF BEER, WINE, AND ALCOHOL PER INHABITANT

| YEAR | Beer in liters | Alcohol (50 per cent) in liters | Wine in liters |
|-----------|----------------|---------------------------------|----------------|
| 1880..... | 169 | 9.21 | 3.71 |
| 1885..... | 162 | 9.25 | 3.30 |
| 1890..... | 179 | 9.29 | 3.54 |
| 1895..... | 192 | 10.56 | 4.12 |
| 1900..... | 221 | 9.37 | 4.65 |
| 1904..... | 219 | 5.84 | 4.32 |

A national congress was held in Paris (Sept., 1903) for the discussion of means and ways to obviate the danger arising to the nation from intemperance. The congress advocated temperance rather than abstinence.

France

It favored the school as an agent in behalf of temperance by means of instruction on the effects of alcohol, and recommended that the government monopolize the sale of intoxicants in order to suppress the low taverns (*cabarets*), and in general regulate the traffic.

There was great need of such a congress, since France leads the list in the annual per-capita consumption of absolute alcohol with 3.72 gallons.

There are a number of temperance societies; the leader is, however, the *Ligue Nationale contre l'alcoolisme*, formerly called *Société Française de Tempérance*. It was founded in 1872. This society is tacitly acknowledged as a clearing-house on questions pertaining to the sale and consumption of liquor in France. It is a temperance organization, not a teetotal; but welcomes all the various means for restricting the sale and diminishing the consumption of liquor; its principal influence is on legislation. The *Ligue* holds conferences, prints and spreads literature, and issues an excellent monthly which keeps in touch with all questions and problems in its domain. The *Union Française antialcoolique* has about 1,500 local societies, chiefly in primary schools, with the motto: "Prohibition of distilled liquors." The *Association de la jeunesse tempérante* has inscribed the salvation of children from the effects of alcohol on its banner, and has grown from 200 "adherents" in 1896—the year of its foundation—to 2,000 in 1904. It holds conferences in schools, establishes local societies, and issues a monthly, *La Jeunesse*. The *Ligue antialcoolique* dates since 1896, and is chiefly concerned with the establishment of asylums for inebriates, and with the diffusion of knowledge on the effects of alcohol. Its paper, *La Prospérité*, stands for teetotalism. By its efforts a total abstinence soci-

ety was organized among railway employees in 1901.

The *Croix Bleue* draws its members chiefly from the Protestants of France, while the *Croix Blanche* endeavors to interest the Roman clergy in the cause of temperance. Through the co-operation of these various societies the government has been induced to prohibit the sale of intoxicating liquors in French military canteens.

In both chambers groups have been formed with a view to secure the enactment of existing, and the promotion of new, legislation.

In the meanwhile the private temperance societies are doing what they can in the way of creating diversions and preventing temptation by the establishment of restaurants free from alcohol, e. g., in Versailles, Bordeaux, Paris (the latter since 1898). The interest in the temperance movement is also shown by the fact that France had eighteen representatives at Stockholm in 1907.

Finland is ripe for prohibition; the Diet has passed a law, but the czar has refused to give his consent.

Italy has a per-capita consumption of 2.40 gallons of absolute alcohol. Drinking is, however, on the decrease.

Table showing consumption of alcohol per head in gallons:

| YEAR | Wine | Spirits | YEAR | Wine | Spirits |
|-----------|-------|---------|-----------|-------|---------|
| 1886..... | 27.06 | 0.317 | 1894..... | 16.94 | 0.271 |
| 1890..... | 20.90 | 0.315 | 1897..... | 16.72 | 0.264 |

There is a temperance society which sent four delegates to Stockholm.

The drinking of vodka or brandy is a national evil in Russia, which forced the government to take action in 1894. A committee was appointed by the czar to investigate the drink

Russia

evil and propose remedies. When the report was received an ukase was published to the effect that, beginning Jan. 1, 1895, the manufacture and sale of vodka and beer would be under the supervision of an imperial committee. There was thus a government monopoly created at one stroke. The distillers and brewers are watched very closely as to the amount and quality of their product. A rigid examination is made, and the output turned over to the government, which dispenses it through its own salaried agents who are not supposed to have any interest in the quantity sold.

The general committee, consisting of men from the best families and high officials, was, furthermore, authorized to create subcommittees in every province of Russia; these again had the power to enlist *cooperators* who are voluntary workers and do most of the active work. There were 25,000 *cooperators* in 1900, working in conjunction with forty-five departmental committees. Each of the latter receives about 50,000 rubles per annum for the purpose of establishing hospitals for inebriates, assisting voluntary temperance societies, spreading knowledge, and creating diversions. In 1898 the forty-five committees had established 1,713 tea-houses and restaurants, 744 lecture halls and libraries, 501 concert halls, 91 popular theaters; arranged 4,658 conferences; staged 602 plays; and managed 445 grand popular fêtes in the open air. The government further assists the temperance cause by making the saloons as unattractive as possible.

The contributions of the government to the departmental committees have increased from about 200,000 rubles in 1895 to 1,797,200 in 1899 and 2,711,000, or \$1,500,000, in 1900.

The effect of these measures is said to be wholesome; drunkenness in Warsaw, for instance, having decreased 20 per cent from 1895 to 1900. The government sold in 1898 about \$125,000,000 worth of vodka and beer at a profit of \$15,000,000. The gain in sobriety, fewer arrests, safety of life and property, is estimated by hundreds of millions.

There is, however, another side to the picture. *The Defender*, New York, reports Aug. 1, 1907, that a member of the Octobrist Party of the late Duma, M. D. Chelysheff, has stated that the dispensary system was demoralizing the Russian peasantry by giving 40 per cent alcohol instead of the weaker stuff of the former tavern-keeper; that the government at first put every obstacle in the way of the voluntary temperance movements, and forbade the clergy to join them; that it took over the sale of liquor only because of the revenue, and has placed dispensaries where the peasants objected to them. This contention seems to be supported by the revenue from the sale of liquor: 117,919,678 rubles in 1900; 169,143,000 in 1901; 462,808,000 in 1902; 609,364,980 in 1905; 568,436,000 in 1906. This increase in revenue has, however, two other explanations: The gradual replacing of private saloons by dispensaries, and the higher price charged for liquor as a war tax during that period. The revenue for 1906 is nearly 41,000,000 rubles lower than for 1905, showing that the government intends to assist temperance. If it is alleged, moreover, that "the Russian peasant drinks only to get drunk" and that the government has helped this unholy desire by its very honesty in giving 40 per cent alcohol compared with the weak stuff of the saloon-keepers, one should remember that it takes more drinks of weak stuff and, consequently, more money to get drunk than on a better quality at the same price. The case of Warsaw with its decrease of 20 per cent drunkenness in five years speaks well for the system, altho no one claims perfection for it, or can refuse to decry the drink evil in Russia.

Spain was up to 1860 a sober country; but has since been drinking more spirits, owing to the adulteration of wines. Its per-capita consumption of absolute alcohol is 2.42 gallons annually. Lately the widespread intemperance has caused alarm, and serious notice is being

Spain

taken of its deleterious effects. The new queen, herself an abstainer, is said to be interested in a reformatory movement.

Switzerland has both temperance and abstinence organizations. The Blue Cross Society was introduced in 1877, and is a strong organization with an increasing membership. Dr. Farel is the most prominent temperance worker, particularly among the French Swiss.

Other Countries

Sweden and Norway are still satisfied with the *Company* or Gothenburg system. It is favored by the temperance people and abhorred by the total abstainers. The former point to the fact that the sale and consumption of alcoholic beverages is decreasing all over the kingdom, and that Gothenburg, for instance, had, in 1907, the same number of saloons with 150,000 population as in 1870 with 50,000; they also refer to the small number of arrests for drunkenness in the rural districts, 1.5 per 1,000 population. The teetotalers point to the 37 arrests per 1,000 for drunkenness in the urban boroughs, and claim that the growth of their societies with a professed membership of over 400,000 in 1907—besides the numerous unenrolled abstainers—is responsible for the reduction of the per-capita and total consumption, while the law has not stopt or even reduced drinking among the non-abstainers. (See NORWEGIAN COMPANY SYSTEM.) The per-capita consumption of absolute alcohol in Sweden is 1.08 gallons and in Norway only 0.54, the lowest of any civilized country, being smaller by 0.17 than that of Canada.

Smaller countries, e. g., Denmark, Holland, are also beginning to be interested in temperance; the

former having an active society. Denmark, for instance, has a number of local temperance societies; and the Danish branch of the Good Templars has over 100,000 members. The government grants financial assistance for the carrying on of temperance propaganda; and private enterprise provides coffee-houses, etc., to promote the cause.

An item of importance in the temperance movement is the attitude of the secular press. Time was not so very long ago when the abstainers and Prohibitionists served as a butt of ridicule to daily and comic papers.

The Press

This attitude has changed materially to one of sympathy in the better class of secular dailies, weeklies, and monthlies, altho the large revenue derived from the advertisements of liquor interests still holds many of them in bondage. Many papers, however, refuse these advertisements. Sweden, for instance, has forty prohibition papers out of 250; and seventy other journals refused advertisements of intoxicants. In the United States five of the best magazines notified the brewers and distillers in 1907 that their contracts would not be renewed for liquor advertising in any form. All of the 700 papers in the State of Kansas are said to have taken the same action some years ago. The religious press stands, of course, for temperance, and many papers favor abstinence. The number of prohibition papers is ever increasing in all English-speaking countries.

How completely the attitude toward alcohol has changed may be inferred from the fact that in the spring of 1907 a manifesto, signed by fifteen leading physicians of Great Britain, was published in the *Lancet*, defending themselves for the pre-

Conclusions

scription of alcohol under certain conditions, and claiming that the moderate use of alcohol was beneficial to adults while maintaining that its abuse was injurious. The manifesto was severely criticized in several secular papers, and a counter manifesto published by the "British Medical Temperance Association," signed by J. J. Ridge, its honorary secretary. In America an answer was prepared by the secretary of the National Temperance Society, and given out for publication to a newspaper syndicate, said to represent several hundred secular dailies and weeklies with 5,000,000 readers—apart from the prohibition and religious journals which published it entire or in part.

The life-insurance companies, too, have become interested in the question of temperance, and some American and British companies give favorable terms to total abstainers, while several companies with lower terms have been established for teetotalers both in England and the U. S.

How wide the movement against alcohol has spread became evident at the "International Congress against Alcoholism" in Stockholm, July 28 to Aug. 3, 1907. Among its delegates were: 2 Rumanians, 2 Servians, 4 Italians, 7 Belgians, 14 Norwegians, 16 Americans, 18 Frenchmen, 19 Russians, 21 Dutchmen, 25 Britons, 31 Swiss, 75 Austrians and Hungarians, 150 Germans.

The enormity of the problem may be gleaned from the fact that in the U. S. a capital of \$260,270,249 was invested in 1896 in the liquor traffic with about 41,500 people employed. This had increased to the enormous sum of \$415,000,000 in 1907. Legal regulation and prohibition have done much; religious and moral influences are

doing more; scientific and medical teaching are just beginning to exert a powerful influence. The most effective aid to temperance, if not to abstinence, is, however, the constant refinement of feeling and the creation of a public opinion through education. Where customs, physical grossness, low tone of morality, demand and favor drinking—no law will prevail. Even the religious convert will frequently backslide, unless his social atmosphere is changed. The only permanent and constantly growing force against intemperance is the refinement of our personal feelings, of our social judgments, and of our moral and esthetic ideas.

TEMPERANCE LEGISLATION BOARD, THE SCOTTISH: Organized 1901 with the object of uniting all sections of the country in an endeavor to obtain further legislation on the lines of Lord Peel's Report (it being understood that support of the board by societies and individuals does not necessarily involve unqualified approval and endorsement of every statement and recommendation contained in that report), and also to strive to secure the effective administration of the licensing laws.

The board has avoided identifying itself with any political party; its aim is to be non-sectional and representative of all who have the welfare of Scotland at heart. And to all such, of whatever party, it appeals for support. The Rt. Hon. Viscount Peel is the president. The secretaries are G. F. Barbour and T. Nicol, 41, Melville Street, Edinburgh.

TEMPLE, WILLIAM: English economist; born London, 1628. Entering the diplomatic service, he represented England at the court of Brussels and in Holland. He sat in Parliament one year, but in 1680 retired from public life. Died in 1699. He wrote, among other books, "Observations upon the United Provinces of the Netherlands" and an "Essay on the Trade of Ireland," in which, says Ingram, he mingled just views and mercantilist prejudices.

TENEMENTS (for statistics, see HOMES, OWNERSHIP OF; also OVERCROWDING. For methods of relief, see HOUSING; MUNICIPAL HOUSING; GARDEN CITIES, etc.): In this article we consider only tenements proper, in the sense of large buildings occupied mainly by families of the working or poorer classes. We consider New York City mainly because here the tenement presents the distinctive housing problem. In most other American cities, like Chicago and Philadelphia, while there is overcrowding with its attendant evils, the working classes and even the very poor occupy small houses rather than tenements. Boston has some of the worst tenements in the United States, but they are few in number compared with those in New York. Cincinnati, after New York and Boston, has the third worst tenements. (See OVERCROWDING.)

In Great Britain the housing question generally is also one of small houses rather than of tenements.

On the Continent most of the larger cities and Berlin especially have large barracks or tenements, but, generally speaking, they are neither so crowded nor so ill kept as in New York. In New York City the problem is undoubtedly at its worst. (See OVERCROWDING.)

The tenements are generally of five or even six and seven stories, built usually on lots of 25x100 feet, and with three or four families on each floor. Many of them are double-deckers, with 100 to 150 persons to a house. Rents are from \$12 to \$18 per month for four rooms, too often mere bed closets, opening on a narrow shaft and generally almost totally dark. In the public hallway opposite the stairs two water-closets often serve fifteen or twenty families.

Conditions, however, are improving. In 1895 a Tenement-House Commission was appointed, and as a result of their report and of further agitation an important Tenement-House Act has been passed, and repeatedly improved and amended, and enforced by a Tenement-House Department. The law now requires each apartment in the new tenements to have a toilet room, determines the proportion of the lot which can be built upon, the minimum amount of cubic and floor space per family, the position of fire-escapes, forbidding the keeping of animals on the premises, etc. Much has been accomplished. In two years, according to the report of the department (1906), 14,000 houses have been supplied with fire-escapes, and 9,000 wood floors of old fire-escapes replaced with iron; 28,000 accumulations of filth and rubbish have been removed from halls, cellars, or yards; 26,000 defective plumbing pipes repaired or replaced; 4,000 dark interiors have been given light and ventilation; 2,000 school sinks and privies have been removed. Yet vast evils remain. In 1904 362,000 dark interior rooms were reported. Jan. 1, 1906, there were still 357,000 such rooms. In the first quarter of 1906 1,031 rooms were provided with windows, at which rate it would take eighty-six years to change all the dark rooms. The department has to supervise 85,000 completed tenements, while in 1905 nearly 6,000 plans were filed for new tenements.

REFERENCE: See HOUSING.

TEXTILE INDUSTRIES AND WORKERS: Textile industries in the United States employ a larger number of workers than any other branch of manufacturing, and in capital invested they are only exceeded by the iron and steel industries. In 1860 the capital invested in them was \$150,080,852; in 1890, \$739,973,661; in 1905 it was \$1,744,169,234. (For statistics, see MANUFACTURING.) In value of product these industries stand third, food products being first and iron and steel products second. The conditions of the operatives in the industries are, however, relatively low, owing to the presence among them of a large population of unskilled female labor. There were employed in these industries in 1905 492,161 men sixteen years or over, and 582,630 women sixteen years and over, with 81,514 children under sixteen, a proportion and number of women and children not approached in any other branch of manufacturing.

On this account largely wages are low, especially in the South. (See WAGES.) In 1905 the Southern cotton-mills produced 2,346,652 bales, the Northern 2,203,406. Organizations in the textile trade began early and have played an impor-

tant part in the labor movement of the U. S., yet developed strong local bodies rather than national organizations. The Spinners' Union at Fall River, at times, at least, has been among the strongest unions in the country. A general International Union of Textile Workers, to include all except the spinners, was formed in 1881, but did not develop except in the South, the New England operatives mainly having unions of their own. In 1905 it had 10,000 members (15,000 in 1903). The National Spinners' Association of America, formed in 1858, was reorganized in 1889, since when it has been steadily successful.

In Great Britain the textile industries are if anything still more important. (See COTTON.) In 1905 the exports of cotton yarn were £10,317,000 (Germany, £1,703,000; France, £750,000); of cotton piece goods, £70,817,000 (Germany, £13,208,000; U. S., £6,000,000; France, £10,562,000); woolen and worsted yarn, £4,244,000 (Germany, £3,176,000; France, £1,490,000); woolen and worsted manufactures, £19,619,000 (Germany, £14,076,000; France, £7,361,000; U. S., £419,000); jute yarn and manufactures, £2,680,000 (France, £562,000); linen yarn and manufactures, £6,340,000 (France, 1904, £1,681,000). (See WAGES.) The main English textile labor organizations are the Amalgamated Association of Operative Cotton Spinners, organized in 1870, with (1904) 18,534 members, and several federations, the United Textile Factory Workers' Association (1883), representing 103,181 members; the Amalgamated Association of Card and Blowing-room Operatives (1886), with 22,420 members, and the North Counties Amalgamated Association of Weavers (1884), with 80,920 members. An International Textile Congress has been formed, the congress of 1905, representing 349,165 members, of which 220,515 were English and 60,000 German.

THÉATE, CH., L.J.: Chief of the Bureau of Labor in Belgium, and publicist; born in Liège, 1866. He was educated in his native city, and visited the university there, receiving the degree of Doctor Juris in 1887. He practised law for a while at the court of appeals. In 1897 he was called to his present position. He is in favor of State interference, but with as little infringement of individual liberty as possible. He is author of commentaries on several Belgian laws; "Lois sur les Règlements d'Atelier"; "Lois sur les Unions Professionnelles"; "Lois sur les Accidents du Travail"; also a number of others along similar lines. Address: Boulevard Militaire, 166, Brussels, Belgium.

THOMAS, JOHN LLOYD: Publicist and manager of the "Mills Hotels and Model Dwellings"; born at Witton Park, England, April 22, 1857; educated at Darlington, England, and Utica, N. Y. Entered journalism and has written much for New York journals and the American Press Association; was editor *The Constitution*, New York, 1890-96; has lectured on social questions in United States, Canada, and Great Britain. He was secretary National Prohibition Party and National Constitutional League for several years, and has traveled in Europe, studying the subject of model dwellings and similar movements for the benefit of working men. He is the author of many pamphlets and magazine articles on municipal and school questions. Address: 161 West Thirty-sixth Street, New York.

THOMPSON, ROBERT ELLIS: Economist; born near Lurgan, in the north of Ireland, in 1844; emigrated to America with his parents in 1857. Graduating at the University of Pennsylvania in 1865, he received the degree of M.A. in 1868, and was chosen instructor in the university in that year, and professor of social science in 1871, and transferred to the professorship of history and English literature in 1881. In 1892 he was elected professor of history and literature in the Wagner Institute of Science. He has lectured on protective tariffs in various universities. Professor Thompson edited the *American Presbyterian* (1866-70); the *Penn Monthly* (1870-81); the *American* (1880-91); the *Sunday School Times* (1891); also the first two volumes of the *Encyclopedia Americana*. He belongs to the economic school of Henry C. Carey. In 1894 was appointed to the position he still holds—the presidency of the great Central High School of Philadelphia. Author: "Social Science and Natural Economy" (1875); "Elements of Political Economy" (1882); "Protection to Home Industry" (1886); "The Divine Order of Human Society" (1892). "History of the Presbyterian Church" (1895); "The Hand of God in American History" (1902); "Nature, the Minor of Grace" (1907). Address: West Rex Avenue, Chestnut Hill, Philadelphia.

THOREAU, HENRY DAVID: Transcendentalist; born Concord, Mass., 1817. In 1837 he graduated at Harvard College and returned to Concord as a private tutor and a school-teacher. He became intimate with Emerson, at times an inmate of his home; he was soon a characteristic member of the new transcendental school. He supported himself by teaching school, by pencil-making, surveying, carpentering, and painting, making every year pedestrian excursions through the woods of New Hampshire. Eccentric in his dress, manners, and mode of life; it is said (tho it is also denied) he never went to church, never voted, and never paid a tax to the state. In 1845 he built for himself a wooden hut in the woods by Walden Pond, and continued to live there—a cultured hermit—for two and a half years. After 1849 he lived at home with his parents and sister in Concord. In 1859 he became acquainted with John Brown, and was so influenced by him as to devote his life to the anti-slavery movement. He combined high culture with the quick instincts, discernment, and love of nature of an Indian; a scornful enemy of every custom not based upon nature, reason, and morality. Died in 1862. He kept a voluminous journal and wrote many essays, from which large selections have since been published. Author: "A Week on the Concord and Merrimac Rivers" (1849); "Walden" (1854); "Cape Cod" (1865), etc.

THORNE, WILLIAM JAMES: Member British Parliament, of Labor Party for West Ham, South; born in 1857 at Birmingham; he lost his father at seven and had to go to work with a roper; a year later he worked in a brick-field, and tried different trades, but finally became an efficient stoker in the retort house on the drawing and charging machine. As a consequence of a strike he lost his work, and tramped to London, where he worked for a gas company. In 1889 he founded the National Union of Gas Workers and General Laborers, and has been its secretary ever since. He has been on the Trade-Union Partia-

mentary Committee for eleven years, and attended three international congresses. At West Ham he is a member of the town council, and was deputy-mayor in 1898. His constituency consists of various societies of working men, chiefly Social Democratic Federation men. Elected to Parliament in 1906. Address: 1 Lawrence Road, Upton Park, E. London, England.

THORNTON, WILLIAM THOMAS: Writer; born Burnham, England, 1813; educated at the Moravian settlement at Ockbrook, near Derby. Secretary to the British Consul-General at Constantinople, 1830-35; clerk in the India House, London, 1835-58; secretary for public works in the India Office till his death in 1880. Author: "Over-Population and its Remedy" (1845); "On Labor: its Rightful Dues and Wrongful Claims, its Actual Present and Possible Future."

THRIFT has been recently called "an eclipsed virtue." It is, perhaps, by many to-day too much condemned, as it was once by most too much praised. In the period when an unbalanced and doctrinaire individualism prevailed in economic thought, the only true help was thought to be self-help. The only abiding way to help the poor was to teach them to help themselves. Under this belief the virtue of thrift was continually exalted by those anxious to remedy poverty. It was shown how, on exactly the same incomes, thrifty persons could manage to get along in comparative comfort, while those without thrift could not get along at all. The inference was that the only way to enable the poor to prosper was to teach them to be thrifty. "A penny saved is a penny earned"; "Frugality is a vast revenue"—these were the lessons taught. It was shown how wise and prudent it was to save and stint, and then invest one's small savings, and so gradually acquire a competence, or at least provision for old age or a rainy day. Penny savings-banks, post-office savings-banks, various provident institutions were founded to encourage thrift.

On the other hand, extreme Socialists and trade-unionists have been wont to condemn thrift. Many Socialists argue that the laborer under competition can only get a living, and that if by thrift he is enabled to live cheaper, he will simply be enabled to work for lower wages. Trade-unionists put the same view usually thus: "Wages depend on the standard of living. The laborer gets, as in all cases of value, just what it costs to produce him. Cheap laborers make low wages. As thrift means cheap living, it is an evil to the laborers as a class, tho it may enable one who practises it to get the advantage of his fellows."

Mr. Hyndman, before the British Labor Commission, argued that to accumulate money in any way is to accumulate orders on other men's labors, and not to benefit the class who so save. All thrift on the part of the working classes, he held, by making them small capitalists, and intensifying competition, increases the evil ("Minutes of Evidence Digest," p. 23). According to Mr. Bax: "To the Socialist labor is an evil to be minimized to the utmost. The man who works at his trade or avocation more than necessity compels him, or who accumulates more than he can enjoy, is not a hero, but a fool" ("The Religion of Socialism," p. 94). According to John Burns, before the Trade-Union Congress at

Norwich, "Thrift was invented by capitalistic rogues to beguile fools to destruction" (Report, p. 55).

The balanced view between these extremes of praising thrift as the one thing needful to prosperity and of condemning it as an evil, is to show that there is truth on both sides. Self-help is not the only necessary help. Cooperation is necessary. Thrifty, competing individuals may lower their wages by thrift; but thrifty cooperation or socialism will not lower wages, and yet will save much for the individual and the community. The rich as a class are much more thrifty than the poor. Waste is never wise. The need is for a thrifty cooperative community.

THÜNEN, JOHANN HEINRICH VON: Political economist; born 1783, the son of a landed proprietor, and became himself the owner of a large estate near Rostock. Political economy was his favorite study: in 1826 he published the first volume of his "Der Isolirte Staat." It is still a matter of debate how far Von Thünen was a Socialist, but many of the opinions to which he gives expression are of a decidedly socialistic nature. Von Thünen's inquiries led to the conclusion that the wages of a laborer only cover the cost of his maintenance, and the interest on the capital employed in his bringing up; for his labor, his exertion, he receives nothing but his life—i. e., his necessary subsistence. Von Thünen thinks that the only way to raise the wages of labor is to increase the cost of bringing up the laborer, and thus he advocates the better education and training of the workman's children, the requisite cost being regarded as an indispensable need.

TILLET, BENJAMIN, was born at Lower Easton, Bristol, England, in 1860. As a boy he had to shift for himself, and roughed it in coal-pits and brick-yards until fourteen, when he went to sea. He spent three years in the merchant service and two years in the navy. By obtaining employment as a tea cooper he was brought into direct contact with dock and wharf work, and experienced the evils of irregular employment. In 1887 he was one of the most active in organizing the Tea Coopers' and General Laborers' Association, and later in organizing the London dockers. (See **DOCKERS' STRIKE**.) Mr. Tillett was elected and has since been general secretary of the Dockers' Union. He is a "progressive" trade-unionist, has been nominated for Parliament by the Independent Labor Party, and has been chosen an alderman of the London County Council. Address: 425, Mile End Road, London, E.

TOCQUEVILLE, ALEXIS CHARLES HENRI CHERÉL DE: Jurist, author; born Verneuil, France, 1805. He studied law and became an assistant magistrate. In 1831 he was commissioned to investigate the penitentiary system of the United States. In 1835 he published his famous "De la Démocratie en Amérique." In 1848 he was elected to the Constituent Assembly. In 1849 Minister of Foreign Affairs for four months. In 1856 he published his "L'Ancien Régime et la Révolution." He died at Cannes in 1859. An opponent of democracy, he foretold its growth in the world, and became one of its first historians. We give two typical quotations from his book.

"Democracy," says De Tocqueville, in a remarkable passage (vol. ii., chap. xx.), "is favorable to the growth of manufactures. . . . Manufactures may possibly, in their turn, bring men back to aristocracy. . . . In proportion as the principle of the division of labor is more extensively applied the workman becomes more

Industrial Servitude

weak, more narrow-minded and dependent. The art advances; the artisan recedes. On the other hand, in proportion as it becomes more manifest that the production of manufactures is by so much the more cheaper and better as the manufacture is larger and the amount of capital employed more considerable, wealthy and educated men come forward to embark in manufactures. . . . In a short time the one will require nothing but physical strength without intelligence; the other stands in need of science and almost of genius to secure success. This man resembles more and more the administrator of a vast empire—that man a brute. . . . Hence it would appear, on searching to the bottom, that aristocracy should naturally spring out of the bosom of democracy. . . . The manufacturing democracy of our age first impoverishes and debases the men who serve it and then abandons them to be supported by the charity of the public. This is a natural consequence of what has been said before. Between the workman and the master there are frequent relations, but no real relationship. I am of opinion, upon the whole, that the manufacturing aristocracy which is growing up under our eyes is one of the harshest which ever existed in the world; but at the same time it is one of the most confined and least dangerous. Nevertheless, the friends of democracy should keep their eyes anxiously fixed in this direction, for if ever a permanent inequality of conditions and aristocracy again penetrate into the world, it may be predicted that this is the channel by which they will enter."

De Tocqueville's final conclusions as to the effect of democracy upon social conditions in America is strange reading to-day. He says, in part, "great wealth tends to disappear, the number of small fortunes to increase; desires and gratifications are multiplied, but extraordinary prosperity and irremediable penury are alike unknown. The sentiment of ambition is universal, but the scope of ambition is seldom vast. Each individual stands apart in solitary weakness, but society at large is active, provident, and powerful; the performances of private persons are insignificant; those of the State immense. There is little energy of character, but manners are mild and laws humane. If there be few instances of exalted heroism or of virtues of the highest, brightest, and purest temper, men's habits are regular, violence is rare, and cruelty almost unknown."

TOLMAN, WILLIAM HOWE: Director of the American Museum of Safety Devices and Industrial Hygiene; born 1861 at Pawtucket, R. I.; educated at Brown University (1882); took postgraduate work in history and politics at Johns Hopkins University; was for three years general agent of the Society for the Improvement of the Condition of the Poor, secretary of the Improved Housing Council, director of the League for Social Service and of the American Institute for Social Service (*q. v.*), and since 1907 of the American Museum of Safety Devices. He has been especially active in promoting exhibits in social economy at various international expositions: Paris 1900, St. Louis 1904, Liège 1905, Milan 1906, Paris 1907, has represented the United States Government at them, has been a member of the International Jury at each, and received numerous awards and decorations, including that of Chevalier de la Legion d'Honneur, the Order of Leopold, and the Prussian Crown, third-class. Author: "History of Higher Education in Rhode Island," 1891; "Municipal Reform Movements in the U. S.," 1894; "Handbook of Sociological Reference for New York City," 1894; "Public Baths and Comfort Stations," 1897, and of numerous essays on industrial betterment. Address: 231-241 West Thirtieth Street, New York.

TOLSTOY, COUNT LEO: Russian author, social reformer; born 1828 at Yasnaya Poliana, a village and estate belonging to his mother's family, and situated near the city of Toula, in Russia. His family has been intimately asso-

ciated with the history of Russia for two centuries, and ranks among the higher nobility. He studied at the University of Kazan, and in 1851 took a commission in the Army of the Caucasus, seeing active service there, and later taking part in the defense of Sebastopol. About this period he published his first novels, including "Childhood, Boyhood, Youth," "The Cossacks," and "Sebastopol." At the close of the Crimean War he made St. Petersburg his home, and became a distinguished member of the literary society there. He traveled extensively abroad, and on his return settled upon his native estate, became a justice of the peace, and applied himself to the organization and management of schools for the peasants, now released from serfdom; he also edited a paper devoted to popular education. After further travel he married, at the age of thirty-four, and made Yasnaya Poliana his permanent home. For fifteen years he wrote his novels there, separated almost completely from society, and there his large family were born and brought up. During these years he composed his two greatest works, "War and Peace" and "Anna Karenina."

At the expiration of this period, and about the year 1877, Tolstoy became impressed with the emptiness of his literary pursuits, and began to ask himself what the meaning of life really was.

Making a careful study of the four Gospels, here at last he succeeded in satisfying himself. He says ("What I Believe," also called "My Religion," p. 10):

The text that gave me the key to the truth was St. Matt. 5:39. "Ye have heard that it hath been said, An eye for an eye and a tooth for a tooth; but I say unto you that ye resist not evil." The simple meaning of these words suddenly flashed full upon me; I accepted the fact that Christ meant exactly what He said, and then, tho I had found nothing new, all that had hitherto obscured the truth cleared away, and the truth itself arose before me in all its solemn importance.

In his book "Life," Count Tolstoy gives systematic form to the theory of life which he deduced from the Gospels. He maintains that man should renounce the individual aims of his life and devote his life in love to his fellow creatures, thus finding his life in doing God's will—that is, in doing unto others as he would have others do unto him, and abstaining entirely from violence. He who enters upon such a life is really born again, for him there is no death. In "What to Do," "The Kingdom of God is Within You," he shows the conclusions to which his beliefs have brought him. He holds that war, government, private property are to be condemned as involving the use of force; that all men should engage in manual labor; that they should avoid luxury; that all should have an equal right in the land; that money is an evil thing, its chief end being the enslavement of the people, and that a life of complete chastity is the ideal toward which men should tend.

His Views

His system is thus seen to be a combination of the philosophy of St. John with the ethics of the Sermon on the Mount literally applied.

The "Kreutzer Sonata," a novel intended to show the author's rigid views upon marriage, was published about the year 1888, and was strangely misunderstood, having been placed under the ban by the Post-office Department in the United States as unfit for transportation in the mails. In an article written in explanation of this book, Tolstoy declares that eventually

love for God and for one's neighbor should replace the physical relations of marriage.

Count Tolstoy's own life gives a fair example of the application of his principles. He has stripped his house of everything not actually necessary; dresses like a peasant and works in the fields; has also learned bootmaking. He confines his writing to the elucidation of his moral and religious ideas, and has published many short moral stories for the peasants. He has become a strict vegetarian, and never touches wine, tobacco, tea, or coffee. During the famine of 1891-92 he and his family did an extensive work in establishing soup-kitchens in the stricken districts. The count has a considerable following in Russia, altho the character of the government in that country makes it difficult to ascertain the real dimensions of such a movement. He has escaped Siberia himself on account of his great international reputation.

Tolstoy has been a voluminous writer, and many of his works have been translated into the principal European languages. Among the English translations, besides those already mentioned, may be named "The Four Gospels, Harmonized and Translated," three volumes; "My Confession," "Ivan Ilyitch," "Family Happiness," "Napoleon's Russian Campaign," "Power and Liberty," "The Long Exile," "The Invaders," "A Russian Proprietor," "Where Love Is," "The Two Pilgrims," "What Men Live By," "Master and Man," "Work While Ye Have the Light." Many of these works are more or less autobiographical, and even in the novels there is usually a leading character who reflects more or less distinctly the personality of the author. He has also written several plays and some books on education, but these have not yet appeared in English.

ERNEST CROSBY.

TOOKE, THOMAS: Economist; born in St. Petersburg, Russia, in 1774, the son of William Tooke, the historian, and at that time chaplain to the factory of the Russia Company, in St. Petersburg. Thomas Tooke was for more than forty years successfully engaged in the Russian trade, but is better known as a pioneer in the free-trade movement. He drew up in 1820 a famous "Merchants' Petition" for free trade. He founded the Political Economy Club in 1831, and promoted numerous industrial and philanthropic reforms. He is the author of numerous writings on currency and trade, the best known being his "History of Prices and of the State of the Paper Circulation from 1798-1856," etc. (6 vols., 1838-57). He died in London in 1858.

TOPOLOBAMPO: A former cooperative colony situated in northern Sinaloa, Mexico, founded by Albert K. Owen, who had obtained valuable concessions from the Mexican Government. A company was formed to develop the colony; its charter was filed in Colorado, and the first colonists were landed in Topolobampo Bay in 1886. An organ of the colony, the *Credit Foncier of Sinaloa*, was started in 1885 in New Jersey and moved to Topolobampo in 1888, edited by Mrs. Marie Howland, and devoted to "integral cooperation." The colonists numbered, in 1892, 446 persons, including 150 children.

The main activities were the developing of the natural advantages of the colony, involving the investment of many tens of thousands of dollars. The main immediately remunerative industry

was a tinware manufactory. Family life was preserved. Differences, however, sprang up. A Free Land Company was formed to oppose the original Credit Foncier Company, headed by Mr. Owen, and the life of the colony gradually ended.

TORRENS LAND SYSTEM: A system used in Australia to keep the title of lands in a public registry, so that a transfer of titles can be made easily, cheaply, and safely, by simply recording the transfer in the registry. It was adopted in Illinois a number of years ago, but soon declared unconstitutional by the Supreme Court of that state. (See LAND TRANSFER.)

TORRENS, ROBERT: Economist; born in Ireland, 1780. He became major-general in India, and was for years in Parliament, prominent as a supporter of the Reform Bill. His views on the Corn Laws were finally adopted by Peel. He died in 1864. Author: "Essay on Money and Paper Currency" (1812); "Essay on the Production of Wealth" (1821); "The Budget, a Series of Letters on Financial, Commercial, and Colonial Policy" (1841-43).

TOTAL ABSTINENCE. See TEMPERANCE; PROHIBITION; PROHIBITION PARTY.

TOYNBEE, ARNOLD: Social reformer; born in London, 1852. He spent two years in a military college, then resided for a year in a retired village on the seacoast, engaged in study and meditation. After this he went to Oxford, where he made a notable mark. In spite of ill health he was appointed tutor to the Indian civilians at Balliol College, and for a time immersed himself in economic studies. Deeply interested in the working classes, he went to Whitechapel (East London) and lived, devoting himself to improving the condition of the poor, and taking part in public and religious meetings. Popular with the men, he felt called upon to lecture against the views of Henry George's "Progress and Poverty," and the strain and excitement of this action on a feeble body, worn by constant labors, was the immediate cause of his death in 1883. From the inspiration of his example arose Toynbee Hall, founded in 1884. (See SETTLEMENTS.) His main work, published in partly unfinished condition, after his death, is "The Industrial Revolution in England." Neither a Socialist nor a Democrat, he had strong tendencies in both those directions, and opposed the doctrinaire character of most orthodox economics, and believed that modern facts show the necessity and value of adopting many Socialist principles. Deeply interested in Church reform, he desired the harmony of Church and State, his conception of Christianity being, the spirit of Jesus applied in all directions, and in all the affairs and relations of life.

TRADE AGREEMENTS: The term "Trade Agreement" is used to designate an agreement covering wages, hours, and conditions of labor, between an association or union of workmen and an association of employers. An essential part of the agreement is the clause providing that there shall be no strikes or lockouts during the term of the agreement, usually one year, but that all disputes relating to interpretation of, or to matters not covered by, the agreement shall be settled by conference between representatives of the

two associations. Sometimes it is provided that in case these representatives cannot agree they shall call in an outsider or umpire. The term Arbitration (see ARBITRATION) is sometimes inaccurately applied to the trade agreement, but arbitration is strictly the reference of a dispute to a disinterested outsider, whereas trade agreements are nearly always drawn up by the representatives of the parties. An exception to this rule was the arbitration of the anthracite coal strike in 1902, when a commission appointed by the president drew up a trade agreement, which the parties agreed in advance to accept for a period of three years. The term conciliation is also often used with reference to a trade agreement, but conciliation is properly mediation by outside parties with the object of inducing the two parties to enter upon a trade agreement of their own framing. The principal trade agreement systems at present in vogue are as follows:

Iron and steel industry, between the Amalgamated Association of Iron and Steel Workers and such companies as the United States Steel Corporation and Republic Iron and Steel Company. The system originated in 1865 and has continued to the present time with three or four interruptions.

Bituminous coal industry, since 1898. Several agreements covering separate competitive fields, the principal one being that of Pennsylvania, Ohio, Indiana, and Illinois, between the United Mine Workers of America and different associations of coal operators. Anthracite coal industry, between the United Mine Workers and the largest anthracite coal producers since 1902.

Longshoremen's agreements between the Longshoremen, Marine, and Transport Workers, and different associations on the Great Lakes and Gulf and Pacific coasts, of dock managers, lumber and grain carriers, and others. Since 1897.

Stove industry, between the Molders' Union and the National Stove Founders' Defense Association. Since 1891.

Newspaper publishers and International Typographical Union. Since 1899.

Railroad Brotherhoods and nearly all railway systems.

The United Garment Workers, United Brewers, Hatters, and Cigar Makers have agreements, or contracts, with individual establishments granting the use of the union label.

In the building trades there are many hundred local agreements, the bricklayers having begun the practice in New York in 1884.

Lithographic Trades Alliance and the Lithographers' Association (National).

The Theatrical Managers and the Musical Protective Union. There are in addition very numerous local agreements.

Examples of the endurance of the severest tests on these agreements are the contracts between the associated bituminous coal operators and the United Mine Workers of America, and the contract between the Lake Carriers' Association and the International Longshoremen's Union. Each party to these agreements has undergone successfully the strain of granting higher wages on the one side and of accepting lower wages on the other. The acceptance of a lower scale by the bituminous coal miners prevented a strike, extending through Pennsylvania, Ohio, Indiana, and Illinois, whose possible consequences no man could foresee, since it might literally have stopped the commerce and paralyzed the industries of the country.

The Stove Founders' Association, composed of 600 of the largest manufacturers in the U. S., has maintained since 1891 a trade agreement with the National Iron Molders' Union. This contract, renewed annually, has withstood suc-

cessfully the severest tests, both of advances and reductions in wages, two of these strains having been especially severe. The executive committee of each organization attends the annual convention of the other.

The manager of the Lake fleets and shipping interests of the U. S. Steel Corporation, Harry Coulby, recently said:

"There are no workers harder to manage than the longshoremen. Yet the discipline of their organization is so thorough and their sense of honor is so high that, when contracts are signed, the employers know just what they can count on. If a new local union attempts to violate its contract, the national organization protects the employers. Had it not been for the steady influence of this organization and the effect of its collective contract, the business of lake transportation would have suffered disaster during the past five years."

JOHN R. COMMONS.

TRADE-UNION BENEFITS (see also INDUSTRIAL INSURANCE): We give here a tabulation of facts. Those for the United States are from the New York State *Bulletin of Labor* (March, 1906).

The national unions belonging to the American Federation of Labor made the following expenditures for benefits in 1905:

| | |
|--------------------------------------|----------------|
| Death benefits..... | \$742,421.23 |
| Death benefits (members' wives)..... | 24,800.00 |
| Sick benefits..... | 58,874.13 |
| Traveling benefits..... | 62,989.71 |
| Tool insurance..... | 5,180.41 |
| Unemployed benefits..... | 25,050.72 |
| Total..... | \$1,503,316.20 |

THE RAILWAY BROTHERHOODS

Exclusive of street-railway employees, there are ten organizations of railway men in the U. S., of which only three (the car workers, trackmen or maintenance-of-way employees, and telegraphers) are affiliated with the American Federation of Labor. Of the remaining seven, five are composed of men engaged directly in the operation of trains and thereby exposed to great risks, against which they insure themselves through the Brotherhood itself or some association closely identified with the Brotherhood. The following table reveals the magnitude of this death and disability insurance at the present time:

| BROTHERHOOD | Members of Brotherhood | BENEFICIARY DEPARTMENTS | |
|-----------------|------------------------|-------------------------|-----------------------|
| | | Amount paid in benefits | Number of claims paid |
| Conductors..... | 36,000 | \$825,000 | 423 |
| Engineers..... | 47,000 | 1,327,500 | 594 |
| Firemen..... | 55,287 | 810,250 | |
| Switchmen..... | 23,000 | 154,800 | 151 |
| Trainmen..... | 74,539 | 1,545,236 | 1,154 |
| Total..... | | \$4,662,186 | |

GREAT BRITAIN

The Board of Trade Report on Trade-Unions (1906) gives the following statistics for 100 of the principal unions:

| | Unemployed, traveling, and emigration benefits | Dispute benefits | Sick and accident benefits | Superannuation benefits | Funeral benefits | Other benefits and grants to members | Total expended, benefit and working |
|-----------|--|------------------|----------------------------|-------------------------|------------------|--------------------------------------|-------------------------------------|
| 1900..... | £263,231 | £149,056 | £308,900 | £180,530 | £95,655 | £34,150 | £3,693,854 |
| 1902..... | 424,046 | 217,970 | 340,506 | 219,096 | 95,296 | 36,334 | 4,379,981 |
| 1904..... | 647,722 | 126,446 | 384,519 | 267,395 | 95,644 | 49,074 | 4,616,230 |

The total membership in these years was respectively 1,149,937, 1,152,634, and 1,127,529.

In Germany and on the Continent generally trade-union benefits are low, partly because the State, particularly in Germany, does so much in industrial insurance, mainly, however, because the trade-unions themselves are relatively weak, tho on the increase. In Germany unemployed benefits are confined to the Hirsch Duncker unions and a few Social Democratic unions. In the Hirsch Duncker unions members receive from six to eight marks per week for thirteen weeks.

TRADE-UNIONISM (see special articles **TRADE-UNIONS IN GREAT BRITAIN**, by Sidney Webb; **TRADE-UNIONS IN THE UNITED STATES**, by Prof. John R. Commons; **WOMEN'S TRADE-UNIONS IN GREAT BRITAIN**, by Miss Gertrude M. Tuckwell; **WOMEN'S TRADE-UNIONS IN THE U. S.**, by Miss Heiron; **AMERICAN FEDERATION OF LABOR**, by William J. Kirk; **COMPULSORY ARBITRATION**, by Samuel Gompers; **UNIONIST AND NON-UNIONIST**, by John Mitchell; cf. also articles **OPEN SHOP**; **TRADE-UNION AGREEMENTS**; **TRADE-UNION BENEFITS**, etc., etc.):

We consider in this article trade-unions in other countries, and the arguments for and against other trade-unionism.

I. Trade-Unionism in Various Countries

(For Great Britain and the U. S., see above.)

In France all industrial organizations, whether of employers, of employees, or of both, are called *syndicats*. Organization of trade-unions of the English type was late in France. (For the history, see **FRANCE** and **SOCIAL REFORM**.)

In 1884 complete freedom of organization was gained. In 1890 there were 1,006 labor-unions with 139,678 members, and in 1905, 4,625 unions with 781,344 members; 3,176 of the unions were federated in 158 federations. The largest number of unions were in the building trades, followed next by transportation and then by the metal trades. In point of membership transportation comes first with 221,683 trade-unionists; metal trades, 90,355; mining and quarrying, 87,166; textile trades, 79,676.

Paris, Lyons, Marseilles, and the Department of Nord are the main centers. French trade-unions are more formally identified with the Socialist movement than English and American unions. (See **SOCIALISM**.) The entrance fee is usually 1 franc, and the monthly dues from 50 c. to 1 fr. The *Chambre Syndicale Typographique* is one of the oldest in Paris, founded in 1839.

In Germany trade-unions (*Gewerkschaften*) are of various kinds. The old medieval guilds (*Zünfte*) were abolished by various laws about 1800; but modern guilds (*Innungen*), mainly of employees, and somewhat patterned after the old, were developed, and were encouraged by the government, which strictly controlled all trade. Trade-unions proper date from 1868.

Herr Fritzsche established a German Union of Tobacco Workers in 1865, and of German printers in 1866.

These were largely socialistic. In 1868 were formed of this type various trade associations (*Gewerkschaften*). Dr. Max Hirsch the same year started a movement with the English trade-union idea. He and Herr Duncker worked together, and by 1869 had formed four such

unions. The principal German unions, however, the socialistic *Gewerkschaften*, in fifty-seven central organizations.

In 1894, however, began a new type of unions, the so-called Christian Trade-Unions, opposed to the asserted materialism and socialism of the *Gewerkschaften*. (See **GERMANY**, p. 539.)

The following table gives for recent years the relative strength of the various types of unions:

| | 1899 | 1904 | 1905 |
|--|---------|-----------|-----------|
| Social Democratic trade-unions (<i>Gewerkschaften</i>): | | | |
| Central federations..... | 580,473 | 1,052,108 | |
| Local unions..... | 15,946 | 20,686 | |
| Total "Gewerkschaften"..... | 596,419 | 1,072,794 | 1,372,539 |
| Hirsch-Duncker trade unions (<i>Gewerksvereine</i>)..... | 86,777 | 111,889 | 117,097 |
| Christian trade-unions: | | | |
| Affiliated to central federations..... | { not | 107,556 | { 188,106 |
| Other..... | { given | 99,928 | |
| Total Christian trade-unions..... | 112,160 | 207,484 | 305,203 |
| Other trade-unions (non-federated)..... | 68,994 | 74,458 | 144,601 |
| Total of all unions..... | 864,350 | 1,466,625 | 1,822,343 |

The Christian trade-unions are strongest in transportation with 83,000, and 44,118 in mining (1904). They reported an income that year of about 1,400,000 marks, and expenditures of about 1,009,000. The Hirsch-Duncker unions are strongest in the metal and engineering trades, with 47,000. They reported in 1904 an income of about 1,080,000 mk. and expenditures of about 880,000. The Social Democratic unions, which are much the largest, had in 1904 243,626 members in the building trades, 117,972 in the metal and shipbuilding trades, and 105,015 in woodworking trades. They reported in 1904 an income of some 20,000,000 mk., and expenditures of 16,600,000 for trade expenses alone and 1,120,000 in industrial benefits. These unions are now rapidly growing in Germany and the Social Democrats are entering them, developing them, and working with them and through them in every way.

In Switzerland trade-unions proper have not been strongly developed, tho they are now attaining more strength. (For the important *Grütliverein*, see **SWITZERLAND**.) An interesting feature of Swiss trade-unionism is that, owing to an agitation in 1886, a federal officer, called the workman secretary, is elected every three years by a congress of Swiss labor societies, organized as a federation, and represents the societies in the government. He is paid by the government. In all, the Swiss Trade-Union Federation had (1904) some 31,137 members, of which 21,000 were in printing and bookbinding trades. In 1907 it was reported at the Stuttgart Socialist Congress that Swiss unions claimed about 50,000 members, besides some 30,000 not affiliated in the central federation.

In Italy labor organizations are of very various kinds. Some are very ancient. The Pious Union of Journeymen Printers of Turin dates from 1710. The Pious Institute of Silk and Felt Hat Makers of the same city dates from 1738. In 1861 a *Frattellanza Artigiana* was started at Florence, and is still strong. In 1871 a *Patto*

del Fratellanza, or pact of working men's societies, was formed at Rome. Both of these were under the influence of Mazzini. Since then most Italian labor organizations are best considered under the head of socialism. (See ITALY.)

In 1902, however, there were reported 480,000 members of labor-unions, of which 240,000 were in agricultural unions. There were reported at Stuttgart, 1907, 365,000 members in 2,657 unions.

Other Countries

In Austria the history of trade-unions is identified with the political history and socialism. (See AUSTRIA.) On Christmas eve, 1893, the first congress of Austrian trade-unions met in Vienna; 270 delegates were present, reporting 20,000 members of unions in Vienna and 11,320 in the provinces. (See AUSTRIA.)

In 1905 there were reported 3,111 unions with 323,090 members, of which 28,403 were women, while at the Stuttgart Congress 448,000 members were reported in 1907. Hungary had in 1905 forty unions with 71,173 members. There were reported at Stuttgart, 1907, 232.

In Belgium trade-unions have long had a firm hold, some of them being descended from the old trade benefit societies, but at present are mainly Socialist societies. (See BELGIUM.) There were reported in 1907 100,000 members in two federated bodies, about 35,000 being connected technically with the Socialist Party. Sweden reported in 1907 144,000 trade-union members; Norway, 25,000; Denmark, 78,000. In all these Scandinavian countries the trade-unions and the Socialist parties are practically different forms of one organization. Holland reports about 28,000 members of unions; Spain, 34,000. It is estimated that there are about 250,000 trade-unionists in Australia. In Australasia, naturally, trade-unions have followed the English model.

II. Arguments for Trade-Unions

The first argument for the existence of trade-unions is that they are necessary to protect the individual employee. For capitalists organized in great corporations to refuse to allow their employees to organize is injustice. Before the gigantic organization of capital to-day the individual employee is helpless. Only by organization and collective bargaining can he at all put himself on a basis of equality in dealings with his employer.

Trade-unions are necessary to allow of arbitration, conciliation, and responsible, enduring relations between workmen and their employers. Boards of arbitration and conciliation cannot deal between employers and each of several hundred employees acting as individuals. In England the large employers have learned to prefer to deal with strong trade-unions. Then responsible bargains can be made for a year ahead between the masters and the men, and the men and the corporations can know what to count on in fixing their prices.

Says Schulze Garvernitz, "Social Peace," tr., pp. 248-250):

The more intellectually gifted employers in the most important English industries have given an ungrudging recognition to the unions, and comparing the present with the former state of incessant strife, they see in the trade-union movement the instrument which is to restore English industry to the paths of peace. He quotes David Dale, a prominent mine-owner, as saying: "Let me therefore declare emphatically, as the result of long and varied experience, that the best se-

curities that employers can have for the rule of reason and the observance of engagements on the part of the operatives of any trade is that those operatives should have among themselves a union strong in numbers and with an able and trusted executive."

Says Prof. Alfred Marshall, in a carefully balanced estimate ("Economics of Industry," bk. vi., chap. xii., section 13):

Little but mischief indeed comes from a weak union, always ready to interfere, but seldom able to secure the faithful carrying out of an agreement, to which its own officers have been a party. But a strong union, guided by able and far-seeing men, who have a grave sense of responsibility, is found to enable a few minutes' quiet conversation to settle innumerable petty disputes that in old times would have caused much delay and worry and loss of mutual good feeling.

Invention and machinery make trade-unions and short hours necessary. Muscular labor has been replaced by machinery (*q. v.*) in different trades from 50 to 300 per cent. This process is going on continually. Typesetting machines displace thousands of compositors. Trade-unions are often the only bulwark between the wage-worker and terrible reductions in wages. They are also the only hope of steady, orderly solution of the labor question. In trades where labor is well organized there are high wages and peace and hope.

The best argument for trade-unions is the simple statement of what they have done. Mr. Trant, summing up what they have done in England, says:

It has been argued: First, that trade-unions have succeeded in raising wages and reducing the number of working-hours. Second, that these reforms do not benefit the laborer at the cost of either the capitalist or the consumer; as, between certain limits, it is found that high pay and the prospect of an early cessation from work are such incentives to industry that the produce of labor is actually greater than under a system of long hours and low pay. Third, that the workmen have such confidence in the benefits they derive from union, that, after the experience of "half a millennium," they are crowding into societies, into unions, in a greater ratio every year. Fourth, that their declared object is to prevent strikes and substitute arbitrations; and altho the latter mode of settling disputes is often proposed by the men and refused by the masters, it is seldom proposed by the masters and still less often refused by the men. It has been argued further, that such being the objects of trade-unions, and such their success in obtaining these objects, the influence of that success must be very beneficial. First, because high wages mean increased comforts, which are not only a social but a commercial advantage. High wages mean increased production, also the double blessing just mentioned. Second, because high wages do not mean enhanced prices, but the contrary. Third, because the principles of trade-unionism teach men the prudence of denying themselves something to-day, in order that they may have greater advantages to-morrow; and the duty of self-sacrifice, by calling upon them to contribute, out of their meager wealth, toward the alleviation of the sufferings of their fellow men. Fourth, because trade-unions endeavor to obtain for the working classes more leisure for recreation and study. Fifth, because by lectures and other means the unions endeavor to make their members better workmen; and by rules which stigmatize and punish the idle, the vicious, and the incompetent, do all in their power to make workmen better citizens.

It is really difficult to conceive how an institution with such noble objects, having attained those objects, can be anything but a great blessing to the community in which it is placed.

In the U. S. trade-unions have produced the same results.

1. They have shortened hours of toil from 13, 14, and occasionally 16, seventy years ago, to 12, 11, 10, and even to 8 in very many trades to-day. This is almost solely due to trade-unions, and has not taken place in portions of the country or in trades where trade-unionism is weak. (See table on page 1233.)

2. Trade-unions have mainly contributed to what rise of wages has been gained.

3. Trade-unions have prevented an unknown number of cut-downs in wages.

4. Trade-unions have gained in many states legislation preventing the truck system, the locking of factory doors in work-hours, the employment of women and children at night, etc.

They have gained legislation protecting the life and limb of employees from ungarded machinery; compelling the erection of fire-escapes, appointing factory inspectors (men and women). They have helped or led in establishing evening schools, labor bureaus, boards of arbitration and conciliation. They have caused to be enacted laws compelling weekly payment of wages, exempting the wages of wives and children from attachment, defining the responsibility of railroad and other corporations for accidents to their employees, above all limiting the hours of labor of women and children.

Such laws have not been passed in all states, nor are they wholly due to trade-union efforts; but they have scarcely ever, if ever, been passed where trade-unions are weak, and in almost all cases it has been trade-union leaders who have attended the legislative hearings, collected the witnesses, and conducted the agitations that have resulted in these laws.

5. The chief benefit of trade-unions is implied in the above, viz., their educational effect. It is said that good trade-unions do good and poor trade-unions do harm, but good trade-unions usually come as the outgrowth of poor and weak trade-unions. Therefore even poor and weak trade-unions are to be encouraged and made strong and good as soon as possible.

6. Trade-unions have been of inestimable use to the working classes as benefit societies. (See TRADE-UNION BENEFITS.)

III. Objections to Trade-Unions

1. It is said that they are tyrannical. On the contrary, they are utterly democratic. In every trade-union, every office, every rule, every strike is voted upon by the members, and the majority prevails. Sometimes a union, after voting to strike, empowers a walking delegate to call the strike when he thinks best; but the decision to strike does not lie with him. It not unfrequently happens that an employer asks an employee why he struck, and the man says he was compelled to strike by his union. Yet often that same employee himself voted to strike. Employees do not usually tell their employers when they vote to strike. Of course, in a democratic organization, a minority submits to a majority, but this is not tyranny. Sometimes, therefore, some men do strike against their will; but if they did not belong to a union they would have their will more crossed by their employers, so that, tho in a union a man does not always have his way, he has it infinitely more often than the employee who belongs to no union.

2. It is said that trade-unions are led by agitators, whose salaries depend on getting up an agitation. This occasionally happens, but very seldom. Trade-unions employ walking delegates for two reasons: (1) To attend to the important beneficiary work of the union; (2) because they have learned that it is necessary to have some one to represent them in dealing with their employers who is not financially dependent upon his employer. This is unquestionably necessary.

3. It is said that trade-unions are mischievous

in creating useless strikes. This is, generally speaking, a mistake. (See STRIKES.)

4. It is said that trade-unions lower the efficiency of labor, interfere with personal rights, and create violence by preventing apprentices from learning trades, by demanding equal wages for union members without reference to skill, by interfering with the employer's right to employ whom he will, and demanding that he employ only union labor, and by attacking non-union labor in time of strikes.

To these objections it is to be frankly admitted that cases of injustice on the part of trade-unions do frequently happen, especially with weak and newly formed unions; but this is not because of trade-unionism, but because the members are ignorant and unwise, and therefore have more need of unions which gradually outgrow such evils. Says Professor Marshall ("Economics of Industry," bk. iii., chap. v., § 3):

In many of the smaller unions there remains to the present day much of the folly and ignorance and selfishness and a little of the violence of earlier times. But we may trust that those faults which are not now found in the largest and best-managed unions will, with the course of time and the diffusion of knowledge, disappear altogether. It is true that even the best unions do not always act up to the principles of unionism as they are expounded by their most enlightened members. But as, when dealing with the economics of trade, we do not trouble ourselves to discuss at length the guiles of dishonest merchants, so when dealing with the economics of unionism, we may accept its principles as they are put into practise by the most enlightened unionists.

As for violence in times of strike against non-union men, called "scabs" by the union men, it undoubtedly often happens, but very often it is conducted by irresponsible young men or boys, and sometimes women, in hate, or in spirit of mischief, and is not conducted by the unionists. The violence against property in case of strike is almost wholly committed, not by unionists, but by the hoodlums that infest most large cities, and are glad of any opportunity to attack the representatives of capital. Most trade-unions are careful to protect property, knowing it for their interest in the long run. (See STRIKES; OPEN SHOP; UNIONIST; NON-UNIONIST.)

Of the complaint that trade-unionists demand equal wages for workmen good and bad, Mr. Trant says (as above):

That unions force masters to pay bad workmen the same wages as good workmen is not true, and the very idea would be scouted by all sensible unionists. The notion that such is the case is, however, very general. . . . True, the unions sometimes agree upon a minimum rate of wages, but this is quite another thing. If a man be not worth that minimum no employer need employ him, while if he be a man of superior skill, or extraordinary working ability, there is no limit to the amount of wages an employer may feel inclined to give him. Of course, where wages are paid by the day, a uniform rate naturally springs in existence.

Ruskin advocates equal wages. He says ("Unto This Last," Essay 1):

"Pay good and bad workmen alike?" Certainly. The difference between one prelate's sermons and his successor's—or between one physician's opinion and another's—is far greater, as respects the qualities of mind involved, and far more important in result to you personally, than the difference between good and bad laying of bricks (tho that is greater than most people suppose). Yet you pay with equal fee, contentedly, the good and bad workmen upon your soul, and the good and bad workmen upon your body; much more may you pay, contentedly, with equal fees, the good and bad workmen upon your house.

"Nay, but I choose my physician and (?) my clergyman, thus indicating my sense of the quality of their work." By all means, also, choose your bricklayer; that is the proper reward of the good workman to be chosen. The natural and right system respecting all labor is, that it should be paid at a

fixt rate, but the good workman employed, and the bad workman unemployed. The false, unnatural, and destructive system is when the bad workman is allowed to offer his work at half price, and either take the place of the good, or force him by his competition to work for an inadequate sum.

Says the late Prof. Thorold Rogers (*q. v.*), of Oxford, concerning trade-unions:

I confess to at one time having viewed them suspiciously: but a long study of the history of labor has convinced me that they are not only the best friends of the workman, but the best agency for the employer and the public; and that to the extension of these associations political economists and statesmen must look for the solution of some among the most pressing and difficult problems of our times.

5. One objection is brought against trade-unions from a very different quarter from those we have considered above. They are declared by some socialistic reformers to be reactionary and useless. This objection, as far as it applies to trade-unions, is usually brought by young and Utopian middle-class Socialists who know very little about what trade-unions are doing. Few working-class Socialists object to trade-unions. But very many working-class Socialists do attack, and that bitterly, the trade-union leaders. They say trade-unions are necessary to-day, but cannot really solve the Labor movement; that only socialism can do that; and that the main use of the trade-union ought to be to educate the workers toward socialism. This, they say, the trade-union leaders prevent because it is for their interest to magnify the organizations which give them a living. Those trade-unionists who refuse to join the Socialist Labor Party they brand as traitors to labor.

The trade-union leaders, however, even those who do accept the ideals of socialism as their ultimate aim, being usually men of some years of experience, know that socialism at the best can come but slowly. They have seen working-class political movements and labor parties come and go. To identify trade-unions as organizations with such political movements, they believe, would endanger the only organizations that are protecting labor interests to-day for at the best questionable and vague hopes.

TRADE-UNIONS, 1907

TRADE-UNIONISM IN THE UNITED STATES:

The history of American trade-unions may be divided into five periods: (1) A formative period reaching down to about 1840, and including the early ten-hour movement. (2) A period of quiet growth on trade-union lines, accompanied by a wave of Fourierite socialism in the country, and then the concentration of all interest in the War of the Rebellion, ending in 1865. (3) A period of active effort on trade-union lines, reaching to 1878. (4) A period of great strikes and efforts at general organization, like the Knights of Labor, culminating in 1886. (5) The present period of the dominance of the American Federation of Labor.

The beginnings of American trade-unionism are not known with definite accuracy. A so-called strike of journeymen bakers is said to have occurred in New York City in 1741, but investigation of the circumstances and of the court records indicates that this was probably a combination of small master bakers with the object of nullifying a municipal ordinance regulating the weight and price of bread. The first organization along the lines of wage-earners of which we have any definite record is that of the journeymen printers of New York in 1776, when they made a demand for an increase of wages, and this being refused, a strike was called. The strike proved successful and the association ceased. In Philadelphia in 1786 an attempt by the employers to reduce wages to \$5.83 a week was made the occasion for calling the trade together. Twenty-six printers signed the document, pledging themselves to mutual support in case of being thrown out of employment on account of refusing to work for less than \$6 per week.

The journeymen cordwainers of Philadelphia had an organization as early as 1792; and the first trial of journeymen for conspiracy took place in Philadelphia in 1806, the union in question being a successor of this one which had been organized in 1792. The typographical unions had developed considerable strength, especially in New York and Washington. The first strike of sailors occurred in New York in 1803. Prior to 1827 most of the organizations in the several trades were secret in character, but the period 1827-37 marks their emergence into open organizations based upon the principle of quitting work under a joint agreement in order to compel acquiescence to demands. This period is therefore the real beginning of trade-unionism. Viewed from this standpoint, while England is considered the home of trade-unionism, the distinction belongs to Philadelphia. Modern trade-unionism, as an industrial and political force, began with the coming together of previously existing societies from the several trades to form a central body on the representative principle. Working by themselves, these isolated societies could accomplish but little in the face of hostile governments and employers. Consequently, they inclined to secrecy or to cloak their movements under the garb of friendly benefits. But when they formed a representative body, they

came out in the open, they encouraged each other in the spirit of aggressiveness, they greatly increased their membership, they organized the workmen in trades previously unorganized. This was the real beginning, not only of trade-unions, but even of the term "trades' union." For the term indicated originally not a union in a trade, but a union of trade "societies." The latter was the usual name of the isolated organizations. The general public, however, which first came to know them and to take alarm when these societies joined themselves in a union of trades, transferred the name of the representative body to the primary body. So that at the present time what was originally a trades' union has sought other names, such as Central Labor-Union, Trades Council, Trades Assembly, or Federation of Labor.

The first trades' union in England was that of Manchester, organized in 1829, altho there seems to have been an attempt to organize one in 1824.

Formation Period

But the first one in America was the Mechanics' Union of Trade Associations, organized in Philadelphia in 1827, two years earlier. The name came from Manchester, but the thing from Philadelphia. Neither union lasted long. The Manchester union lived two years, and the Philadelphia union one year. But the Manchester union died, and the Philadelphia union metamorphosed into politics. Here, again, Philadelphia was the pioneer, for it called into being the first labor party. Not only this, but through the Mechanics' Union Philadelphia started probably the first wage-earners' paper ever published—*The Mechanics' Free Press*—antedating, in Jan., 1828, the first similar journal in England by two years. The political movement, begun in Philadelphia, was taken up by New York, Albany, and Troy in 1829, by Boston in 1830, and by other places in the same years. It disappeared altogether in 1831, after the older political parties had borrowed its planks and captured its leaders.

But the trades' union was again inaugurated two years later, in 1833, this time with a resolution learned from experience to "keep out of politics." New York now took the lead, and organized the "General Trades' Union," bringing the name from England. Baltimore and Philadelphia quickly followed, and in the next four years there were trades' unions in a dozen cities from Boston to Washington, and even as far west as Louisville. In New York, Baltimore, and Philadelphia these trades' unions were remarkably aggressive and successful, and certainly in Philadelphia in 1835 and 1836 there was a larger proportion of the population enrolled as members of labor organizations than there has been at any time in the seventy years that have followed.

In 1834 these local unions formed a national association, which they called The National Trades' Union, with a constitution and officers. Altho England also had its so-called national organization in 1834 under the stimulus of Robert Owen, this fell to pieces in six months, while the National Trades' Union in the United States held three conventions with increasing influence in 1834, 1835, and 1836. The national union in England covered a few counties. The one in America stretched from Boston to Cincinnati. The American movement was not imported from England; it was an indigenous product of American conditions, and its leaders

were American-born. Altho the daily papers of this time in America abounded with news of strikes and with editorials of advice to restless mechanics, yet the remarkable national labor organization that backed these strikes was barely mentioned, and has been as utterly forgotten as the lost tribes of Israel or the continent of Atlantis.

The authentic sources from which to learn of these associations are the labor papers; and it is fortunate that these have been preserved in unexpected abundance in a few libraries. Out of some forty titles the principal ones have been located through the search set up by the American Bureau of Industrial Research. Aside from *The Mechanics' Free Press*, already mentioned, the most valued is a daily paper—*The Man*—published for sixteen months in 1834-35 under the influence of the Trades' Union of New York. Another is *The Working Man's Advocate* of 1829-30, the first of the New York labor papers. More important is *The National Laborer*, the organ in 1836 of the Philadelphia union and the National Trades' Union.

The labor movement of this period has usually been treated as a communistic or agrarian agitation, but this is because our knowledge of it comes only from the papers hostile to it or from Robert Dale Owen's *Free Enquirer*. Robert Owen had founded New Harmony in 1825 with an amount of advertising never before or since secured for a radical program. When his followers scattered after 1827, they attached themselves to whatever elements dissatisfied with political and industrial conditions would give them a hearing. As soon, however, as the import of their teachings was understood, the mechanics and working men withdrew support and limited their movement to the immediate demands of legislation or of trade-unions.

The Mechanics' Union of Philadelphia sprang from an unsuccessful strike of the carpenters for a ten-hour day. There the labor party held the balance of power in two elections, and all of its candidates who were indorsed by the Adams and Jackson parties were elected. Even the congressional candidates of the older parties flung out their banners as the "true working men's party," and appropriated the slogan of "6 to 6," which the working men had used to indicate their demand for the ten-hour day. The labor party disappeared entirely in 1830, and the American politician had learned for the first time how to split the labor vote.

In New York the movement of 1829 was much more complicated than it was in Philadelphia, more radical in its demands, more distinct in its cleavage of classes, and attended with greater immediate success. It began with a meeting called to protest against increased hours of labor. The meeting adopted an agrarian preamble drawn up by a mechanic, Thomas Skidmore, and transporting into economics the Declaration of Independence. They resolved that "the Creator has made all equal," and that "in the first formation of government no man gives up to others his original right of soil and becomes a smith, a weaver, a builder, or other mechanic or laborer, without receiving a guaranty that reasonable toil shall enable him to live as comfortably as others." They contemplated a strike, and not a political party. Six months later they nominated a ticket selected by lot and adopted another agrarian platform, again drawn up by

Skidmore, and accidentally elected a carpenter to the legislature. Three months later they ousted Skidmore and took up Robert Dale Owen. He persuaded them to renounce agrarianism and to indorse free education, but his free schools were to take the children away from their parents, to dress, feed, shelter, and teach them alike. He would substitute for Skidmore's communism of property a Pestalozzian communism of education. On this the party split. Tammany finished the disruption by enacting the mechanics' lien law—the first law of its kind to protect the journeyman as well as the contractor. Four working men's tickets then came into the field. The biggest vote went to Tammany and the smallest to Skidmore. Thus Tammany won its first success as the "workingman's friend," and Socialists had their prototype in the agrarians.

Outside Philadelphia and New York the working men's party included small employers. In Boston its platform appealed to "laboring men, mechanics, tradesmen, farmers, and others standing upon the same level." So in Charleston, Wilmington, and elsewhere. The class division of employer and employee was as yet limited to a few localities. Labor politics was a part of the general protest of the times raised by the "productive classes" against "aristocracy."

Four years of inaction followed the disruption. The stage was filled by Jackson and the Bank. When the Bank disappeared, its place was taken by a host of state banks with a flood of paper money. In 1835 and 1836 prices and the cost of living rose 50 to 100 per cent. Wages did not rise in the same proportion. The inflation came so suddenly that wage-earners could not escape to the free lands of the frontier. They were caught in a trap. They turned to their newly found trades' unions and to their National Trades' Union, which had held its first convention in 1834. They attributed to these organizations a permanence and grandeur pathetic in view of the collapse three years later, but excusable in view of the victories meanwhile. Not until thirty years afterward, in a similar inflation of the Civil War, did organized labor appear again in similar vigor. The trades' union of 1833 was a generation ahead of the industrial conditions that give organized labor endurance. It was not an industrial revolution, as in England, but a financial inflation, that provoked the labor movement of 1835.

The many strikes of 1835-36 are well known. The fact that they were systematically supported by extensive organizations of labor is not so well known. The climax was reached in 1836. Prices continued to rise, and the societies continued to strike. Their successes were inspiring. The trades' unions supported them with enthusiasm and devotion. Dues were increased and donations added to dues. Finally, the ominous sign of overorganization appeared. Jurisdictional struggles began. Blacksmiths protested against horseshoers, and hand-loom weavers against factory weavers. These were not settled when the panic of 1837 stopped everything, and the trades' unions disappeared when the wage-earners' employment ceased.

The issues that aroused the wage-earners may be learned from the debates in their conventions. The first national convention discust politics. The controversy raged back and forth exactly as it does to-day; but, finally, the convention excluded the word "political" from its objects

and substituted the word "intellectual." In each convention they discust education, public lands, immigration, child labor, female labor, prison labor, lotteries, banking, and cooperation.

Here were the beginnings not only of the general organization of labor, but also of humanitarian and reform movements. The industrial revolution was under way, but its substantial basis—the railway—was not yet a factor. In general the period was that of the sudden and rough awakening of labor as a distinct element in American history. For the first time magazines and newspapers gave space to labor problems. Humanitarians began to examine the conditions of working and living. Politicians put labor planks in their platforms. Protectionism framed its pauper-labor argument, and manufacturers proceeded to capitalize the labor movement. Some demands were immediately granted, others remotely. Imprisonment for debt disappeared before 1835. Free schools became general before 1850. Mechanics' liens have spread from New York to all other states. The ten-hour day became the standard. Juries began to return verdicts of "not guilty" in labor conspiracies. The importance of free land as an outlet for labor was first realized, and leaders of the homestead agitation learned their lesson in the predicament of the trades' unions of 1835.

The second period of growth on trade-union lines did not reach marked development until about 1844, after seven years of depression had attracted attention to the sufferings of the wage-earners, and had served to bring forward agitation along the lines of Fourierite socialism. Horace Greeley espoused this movement and *The New York Tribune* opened its pages to its advocacy. Many phalanxes were established, of which Brook Farm, near Boston, is the most famous. The organization of labor proceeded with considerable activity. The New England Workingman's Association was organized in 1845, but it was largely controlled by such men as Charles A. Dana, George Ripley, Albert Brisbane, and others connected with the socialistic and antislavery movements. A

1844-1866

A nearer approach to industrial organization appeared in 1845, when the National Reform Convention was held in New York. This, however, was preliminary to the National Industrial Congresses, which began their sessions in 1846 and continued until 1854. These congresses were held at New York, Philadelphia, Cincinnati, and Chicago, and were attended by delegates from many different kinds of reform organizations including trade-unions. Horace Greeley presided at several of them. The Industrial Congress of 1850 adopted a platform dealing with the following subjects:

1. Homestead exemption.
2. Land freedom for all unoccupied lands.
3. Land limitation.
4. Independence of labor by land freedom and labor organizations in which every toiler will be a proprietor and as far and as soon as possible an equal proprietor.
5. Free trade and direct taxation.
6. Abolition of all laws for collection of debt.
7. Schools and colleges.
8. Abolition of all banking.

Eventually these congresses became absorbed solely in the land question and were the predecessor of the Homestead Law of 1861. The slavery agitation, which reached a crisis in 1854, absorbed the attention of the country; consequently these reform movements, as well as the

trade-union movement, were thrown into the background. It was in this period that the first national organization of a trade was effected, which has continued until the present time, namely, that of the National Typographical Union, organized in 1851. This trade had held a convention as early as 1836, but that convention was not followed by any permanent organization. In 1862 the Typographical Union adopted the name *International* in order to admit Canadian unions, and this term when employed by American organizations usually means simply the inclusion of Canadian local branches. The next national organization was that of the hat finishers, in 1854, followed by the iron molders in 1858 and the machinists and blacksmiths in 1859. These were the only national organizations of labor prior to the Civil War.

The Civil War period introduced a situation quite similar to that of 1835-36, namely, the enormous increase of prices owing to the paper-money inflation. This inflation began about 1862 and was in full swing in the middle of 1863. Its first impression which has left a permanent record is found in the publication of *Fincher's Trades' Review*, the first number of which appeared in July, 1863. This journal did much toward the organization of labor during the Civil War period and was assisted by *The Daily Evening Voice*, published by the printers in Boston during the years 1864-67. During this period national organizations were formed by the locomotive engineers in 1863, the cigarmakers in 1864, the bricklayers and masons in 1865; and a large number of cities recruited the organizations by central labor-unions or trades assemblies similar to those characteristic of the period 1827-37. In the '60 period state federations or trades assemblies were organized, and the one in New York has had a continuous existence until the present time. A combination of these local, state, and national organizations was found in the *National Labor-Union*, which held

National Labor Union

its first convention in 1866. The leading spirits in bringing about this national movement were Jonathan Fincher of the Machinists' and Blacksmiths' Union, editor of *Fincher's Trades' Review*; William H. Sylvis, president of the Iron Molders' Union; and A. C. Cameron, of Chicago. William H. Sylvis stands forth as the most important labor leader of that period, and it was through his tireless efforts and great enthusiasm and sacrifice that labor organizations were formed in many places throughout the country. The convention was representative not only of trade-unions proper, but also of eight-hour leagues and city trades assemblies. After a session of four days it adopted resolutions declaring that the first and grand desideratum is the eight-hour day; that every workman should connect himself with his labor organization; that every local union should be represented in a trades assembly; that each trade should form a national and international organization; that cooperation is a sure and lasting remedy for the abuses of the present industrial system; that prison labor should be restricted, and the public be requested not to patronize parties who contract for prison labor except they pay the rate of wages demanded by mechanics outside; that labor organizations should cooperate with working women and factory operatives in their efforts to ameliorate their condition; that agricultural

interests in the South should be speedily restored by action of Congress; that tenement-house reform was essential to the welfare of the whole community; that the public domain should be disposed of to actual settlers only at a minimum price; that all honorable means should be exhausted before resorting to strikes; that mechanics' institutes, lyceums, and reading-rooms should be encouraged in all cities for the use of working men; that working men out of employment should proceed to the public lands and become actual settlers. This platform was substantially reproduced at succeeding meetings of the National Labor-Union, but with the addition in 1868 of an extensive discussion of the money question and the adoption of a resolution that the "issue of treasury notes be made a legal tender in the payment of all debts, public and private, and convertible at the option of the holder into government bonds bearing a just rate of interest, sufficiently below the rate of increase in the national wealth by natural production as to make an equitable distribution of the product of labor between non-producing capital and labor." The National Labor-Union held annual conventions until 1872, when in connection with farmers' organizations it nominated presidential candidates. This resulted in the wrecking of the organization and the repetition of the experiences of forty years before, which has led trade-unions generally to adopt the policy of keeping themselves free from politics. It was during the activity of the National Labor-Union that the eight-hour movement took on a more aggressive form than it had ever taken before, and it received its first philosophical and scientific statement at the hands of Ira Steward of Boston, a member of the Machinists' and Blacksmiths' Union. A Grand Eight-Hour League was organized, but endured only for a short time. It was followed in 1869 by the Boston Eight-Hour League, which with the help of Wendell Phillips secured the establishment of the Massachusetts Bureau of Statistics of Labor, the parent of all other labor bureaus. There were many strikes for shorter hours, and out of the agitation developed the policy of Congress and American states and cities in establishing eight hours as a legal working-day. Congress adopted the eight-hour bill in 1868 and another act in 1869 regulating the compensation for eight hours so that it should be the same as it had been prior to the reduction in hours. The leaders of the National Labor-Union were in correspondence with the International Working Men's Association and a delegate was sent to the convention at Geneva in 1867. Among the trade-unions which sprang up during this period the Knights of St. Crispin were the most powerful, altho exceedingly short-lived. Its period of prominence was during the years 1869-72, but its attitude toward the introduction of labor-saving machinery and the vigorous onset of the employers practically destroyed the organization after 1874, altho it held a nominal existence for two or three years later. At that time the Coopers' Union was among the first in importance, but it likewise was destined to go down before the introduction of machinery. The presidents of the Coopers' Union and the Machinists' and Blacksmiths' Union joined together in 1872 to organize a national movement which should be free from politics and should be representative of the national trade-unions. Their efforts were unsuccessful owing to the policy of the national

leaders who feared that their authority in their own trades would be undermined. However, an important national convention was held in 1874 which adopted the name of the Industrial Brotherhood along with a platform derived partly from that of the National Labor-Union. This platform afterward was adopted almost without change by the Knights of Labor. The latter organization was first established as

Knights of Labor

a local secret labor-union in Philadelphia in 1869 through the efforts of Uriah S. Stevens, a clothing cutter. It continued its policy of secrecy until 1879, at which time T. V. Powderly was chosen General Master Workman. The Knights of Labor aimed to bring all labor men into one great organization without reference to the trade-unions to which they belonged. Its growth was rapid until 1886, at which time its membership was over five hundred thousand. Several disastrous strikes caused a reaction, especially that of the packing trades in Chicago, and the one on the Gould system of railways south and west of St. Louis, but, more than anything else, labor at this time received its severest blow from the Haymarket riot in Chicago, and the bomb which killed the policemen who were endeavoring to suppress an open-air meeting. During the two or three years following there was very little activity, but in 1890 a new organization, the American Federation of Labor, started its comprehensive plan of inaugurating an eight-hour working-day. The American Federation of Labor was formally organized in Columbus, Ohio, in 1886, as the successor of the Federation of Trade and Labor-Unions which had held its first meeting in Pittsburgh in 1881. The principles of the American Federation of Labor were opposed to those of the Knights of Labor in that they recognized the full autonomy of each trade to regulate its own internal affairs. Its plans, however, were made so as to assist each trade in the support of all other trades. Under this arrangement the carpenters, in 1890, were authorized to lead the movement for eight hours. They were successful in many cities. In 1891 the miners were authorized to follow, but they were unsuccessful owing to the deprect conditions in their trade and the dual form of their organization.

Since the time when the National Labor-Union and the International Working Men's Association exchanged fraternal delegates, there has been

Recent Developments

more or less controversy between the Socialists and the trade-unions. The leaders of the various socialistic parties have made bitter attacks on the trade-union leaders and have endeavored to capture the movement for political socialism. They have organized separate trade-unions on a socialistic basis at various times, but these have not achieved any marked success. Their principal influence has been in supporting one side of the internal conflict in the ranks of organized labor growing out of the two policies of organization by trades and organization by industries. Industrial unionism, by which is meant the enrolment in one organization of all of the employees in an industry, has appealed to the socialistic element as the proper line of organization. Three of the strongest organizations in the American Federation of Labor, namely, the mine-workers, longshoremen, and the brewery workers, are based upon this principle, but the great mass of organized labor follows the principle of trade

organization. In 1893 the American Railway Union, organized by Eugene V. Debs, attempted to introduce the industrial principle in the organization of railway employees. The great organizations of Locomotive Engineers, Firemen, and Conductors are outside the American Federation of Labor and they recognize the trade principle. The failure of the American Railway Union and similar organizations has served to strengthen the plan of trade autonomy, and the strength of this principle is shown in the recent expulsion of the Brewery Workers from the American Federation of Labor on account of its attempts to organize firemen and engineers. After a period of remarkable success in organization following a long period of depression ending in 1897, many jurisdiction troubles arose, and much of the time of the American Federation of Labor has been occupied in mediating between conflicting organizations.

One of the distinctive features of American trade-unions is the great variety of nationalities and languages embraced within the same union. This became more apparent in recent years than before on account of the extension of the recruiting area of immigration to the east and south of Europe. The characteristic organizations of recent years are those made up of immigrants and unskilled labor following the introduction of labor-saving machinery and minute division of labor in all branches of industry and the liberal policy of encouraging immigration. These conditions have changed the character of the organization in the boot and shoe industry so that instead of the journeymen cordwainers as represented in the Knights of St. Crispin, the Boot and Shoe Workers' Union of the past ten years is a comprehensive organization of all employees in the trade. Another characteristic of American unions is the adoption of the union label which is a guaranty to the purchasing public that the goods bearing the label were manufactured by union workmen. The label has been of the greatest advantage to the Cigarmakers' Union and of considerable importance to the Garment Workers. Another trade represented by the Typographical Union in more recent years began to place greater emphasis upon its label as a means of organization. There are some sixty trades with labels, but the importance of these devices depends upon whether the union in question manufactures an article which is sold directly to working men.

JOHN R. COMMONS.

Effect of Trade-Unionism on Wages and Hours in the U. S.

The statistics in the following table as to wages and hours are taken from the *Bulletin* of the U. S. Bureau of Labor (Aug., 1907). The statements as to the strength of organization in the different trades are generalizations for the whole country, submitted to trade-union leaders, Professor Commons, and others. The connections between the two sets of facts are obvious. It must be remembered that not a few trades, tho generally weakly organized, are strong in some localities and sections or vice versa, and that these facts are estimates of general conditions in the trade.

The table on page 1233 shows almost absolutely, with very few exceptions, and these admitting of explanation, that complete organization is necessary for high wages and short hours.

| TRADE OR OCCUPATION | Organiza- tion | Hours per week | Changes 1890- 1906; 1890- 100 | Wages per hour | Changes 1890- 1906; 1890- 100 | Notes |
|------------------------------|-------------------|----------------------|---|----------------------|---|--|
| Bakers, male..... | Poor | 60 | 91.8 | \$0.25 | 127.4 | (1) |
| Boot and shoe workers..... | Fair | 56 | 97.6 | 0.31 | 132.4 | (Lasters, male)? |
| Bricklayers..... | Strong | 46 | 91.9 | 0.62 | 138.6 | (2) |
| Building laborers, male..... | Poor | 54 | 95.4 | 0.19 | 122.5 | |
| Carpenters..... | Fair | 48 | 89.7 | 0.40 | 141.6 | |
| Cigarmakers, male..... | Partial | 55 | 106.7 | 0.31 | 117.6 | (1) |
| Clothing cutters..... | Strong | 49 | 97.2 | 0.42 | 109.9 | (Machine, male.) |
| Compositors, male..... | Strong | 51 | 92.8 | 0.35 | 120.3 | |
| Conductors, railroad..... | Strong | | | 3.04 | | Per day. |
| Electrical workers..... | Fair | 48 | 87.0 | 0.40 | 152.5 | (Wiremen in houses.) ³ |
| Engineers, railroad..... | Strong | | | 3.65 | | Per day. |
| Glass workers..... | Strong | 42 | 100.1 | 0.90 | 146.3 | Window-glass highest wage paid. ¹ |
| Granite-cutters..... | Strong | 47 | 91.3 | 0.43 | 121.7 | |
| Hatters, caps and furs..... | Strong | 53 | 98.9 | 0.49 | 121.1 | Curlers, male; highest wage paid. ¹ |
| Horseshoers..... | Poor | 54 | | 0.36 | | |
| Horse-Smiths..... | Fair | 49 | | 0.47 | | |
| Iron-molders..... | Strong | 56 | 95.1 | 0.32 | 123.8 | Foundry and machine shop. |
| Machinists..... | Fair | 55 | 96.7 | 0.32 | 118.6 | Car manufacture. |
| Metal polishers..... | Fair | 54 | 92.8 | 0.36 | 117.7 | Brass finishers in car manufac- ture. |
| Painters..... | Partial | 47 | 89.7 | 0.38 | 136.8 | (1) |
| Plasterers..... | Strong | 46 | 90.0 | 0.59 | 148.7 | |
| Plumbers..... | Strong | 46 | 90.2 | 0.53 | 141.9 | |
| Pressmen, male..... | Strong | 55 | 98.7 | 0.22 | 118.6 | |
| Sheet-metal workers..... | Strong | 57 | 96.5 | 0.42 | 145.1 | Cornice makers. |
| Street-cleaners..... | Poor | 48 | 91.0 | 0.22 | 114.9 | Municipal work; contract, 56 hours 19 cents; change 93.3 and 139.8. |
| Trainmen..... | Fair | | | 1.90 | | Per day. |

¹ This trade is on the whole poorly organized, therefore general averages are poor, but those workers in the trade who are organized have now good conditions.

² Idle two to four months in the year.

³ Poorly organized on the Atlantic coast. Strong on the Lakes, Gulf, and Pacific coast.

TRADE-UNIONS IN GREAT BRITAIN AND IRELAND:

Contrary to a popular impression, there is no evidence of any connection between the medieval guilds and the essentially modern institution of trade-unionism. The combinations of journeymen, which were not unknown in the England of the fourteenth and fifteenth centuries, appear to have been ephemeral and unstable. Not until the latter part of the seventeenth century do there seem to have arisen durable associations of wage-earners in particular trades, having for their object the protection and advancement of their economic position. The first of such associations as yet discovered is that of the woollen workers of the west of England, traced as existing in Devonshire in 1700. In 1720 the master tailors complain to Parliament that

History

The Journeymen Taylors in and about the cities of London and Westminster to the number of 7,000 and upward have lately entered into a combination to raise their wages and leave off working an hour sooner than they used to do; and for the better carrying on of their design have subscribed their respective names in books prepared for that purpose, at the several houses of call or resort (being public houses) which they use, and collect several considerable sums of money to defend any prosecutions against them.

Parliament listened, and prohibited such combinations, but the tailors seem to have continued their organization, centering around the "houses of call," for in 1810 a master declared before a select committee that their combination had existed over a century. Combinations, however, were illegal, and so were usually disguised

as sick and funeral clubs, while perhaps still more often bona fide friendly societies gradually came to act as and finally to become trade-unions. The Society of Taylors of London in 1760 says: "It has been an ancient custom in the kingdom of Great Britain for divers artists to meet

together and unite themselves in societies to promote amity and Christian charity." The Newcastle shoemakers organized in 1719. The London Sailmakers' Burial Society dates from 1740. The Glasgow coopers organized in 1752. At Nottingham in 1794 fifty-six clubs joined in the annual procession. Local friendly societies sprang up everywhere. The rules of over 100 of these formed between 1750 and 1820, centered around Newcastle-on-Tyne, are in the British Museum. Adam Smith says: "People of the same trade seldom meet together, even for merriment and diversion, but the conversation ends in a conspiracy against the public or in some contrivance to raise prices" ("Wealth of Nations," bk. i., chap. x.). Often a strike ended in a permanent organization.

All such combinations "in restraint of trade" were unlawful, both at common law and under various statutes. Especially during the Napoleonic wars, when the ruling classes were full of apprehension of sedition, were these "Combination Laws," as they were called, enforced with ruthless severity. The harsh punishments and legal tyranny of this period made the trade-unions all the more lawless. Economic oppression in these years went hand in hand with judicial persecution. In 1814 the last vestige of the Elizabethan Statute of Apprentices was repealed, and with it disappeared any pretense of maintaining the workers' standard of life. But within a decade the tide had begun to turn. In 1824, mainly by the efforts of Francis Place (*q. v.*) out of Parliament, and Joseph Hume in Parliament, the laws against combinations (see CONSPIRACY LAWS) were repealed, and freedom of association seemed won.

In the following year, however, the alarmed ministry reimposed part of the legal prohibition of trade combinations, and the judicial persecutions began again. In 1834 six

Legislation

harmless farm laborers of Dorsetshire were sentenced to seven years' transportation for merely joining a trade-union which had among its initiation ceremonies the taking of an oath. It may here be said that complete freedom of association was not accorded until 1875, when the last remnant of penal legislation was repealed.

The history of trade-unionism in the United Kingdom may be conveniently divided into four periods. The first, lasting down to 1824, includes the origin of the movement, and its early struggles for recognition. This was followed by a "revolutionary period," when the trade-union movement was dominated by the Owenite movement and the Chartist political agitation. A third period, lasting down to 1880, covers the development of trade-unions into strong trade-benefit societies, largely ignoring and sometimes even opposing political action. The last period, reaching to the present, includes the development and then the partial subsiding of the first wave of what is called the new trade-unionism.

The first period we have already considered; the second period really belongs to Owenite socialism and to Chartism (*q. v.*) rather than to trade-unionism. The Lancashire and Yorkshire textile and building operatives were the pioneers of this phase of the movement. The unions were never a part and parcel of this movement, tho many of their members and a few organized unions did belong to it. No unions contributed to Chartist funds, and the leaders of the unions were often denounced for their apathy by the Chartists. The virtual collapse of Chartism in 1842 and its final end in 1848 set the unions wholly free to develop their non-political methods. (For the passage of factory laws, the short-hour movement of Oastler, "the factory king," the efforts of Lord Shaftesbury and of others, culminating in the ten-hour act of 1848, see FACTORY LAWS; SHORT-HOUR MOVEMENT; OASTLER.) But after 1842 the unions devoted themselves to building up their own organizations. Those which were

Date of Organizations

organized before this period now developed their characteristic policy and strength. The Friendly Society of Iron Founders was organized in 1809, but the much larger Amalgamated Society of Engineers was only formed in 1850. The Steam-Engine Makers' Society dates from 1824, the Associated Iron Molders' of Scotland from 1831. The United Society of Boiler-Makers and Iron Ship-Builders dates from 1832, as does also the Operative Stone-Masons' Friendly Society. The Operative Bricklayers' Society was formed in 1848. The Amalgamated Association of Operative Cotton Spinners dates from 1853, the Yorkshire Miners' Association from 1858. The Durham Miners' Association was not organized till 1869. The Amalgamated Society of Tailors appears in 1866, the National Union of Boot and Shoe Operatives in 1874. The Amalgamated Society of Carpenters and Joiners was formed in 1860, and the Northumberland Miners' Mutual Confident Association in 1863. But these dates do not clearly indicate the actual course of events. As a matter of fact, the decade from 1840-50 saw a marked revival of trade-unionism. In 1843 a strong Potters' Union and an active Cotton Spinners' Association were formed, and in 1844 a National Typographical Society. Still more important was the Miners' Association of Great Britain and Ireland, formed in 1841, and, under the leadership of Martin Jude, sending out fifty-

three organizers who visited every pit in the kingdom, obtaining, it is said, in 1844 a membership of over 100,000. In 1845 a National Association of United Trades for the Protection of Labor was formed. It was not, however, political, like

The Trade-Union Idea

Owen's attempts, and with moderation and good management endured fifteen years. The unions of this period, as indicated by their names, were largely benefit societies. They expected and sought little from legislation, tho they strenuously fought against legislative oppression. They depended on organizing their own crafts, collecting dues, employing a paid secretary, aiding unemployed members.

The men of this period laid stress on the power of workmen in combination to obtain advances by collective bargaining, peaceful abstention from taking work under price, and great reserve funds. Among the coal-miners and iron-workers they accepted for almost a generation the assumption that wages should follow the price of the product, and thus they agreed to let the rate of wages be determined automatically according to sliding scales (*q. v.*), a plan now almost completely abandoned. But the leaders of this period did not abstain from political action. Under the leadership of Allan, Guile, Coulson, and Odger, acting as a sort of junta, the rich and powerful trade-unions drew together to resist the attacks that were being made on trade-unionism, to secure reforms in the law as to the terms of employment, to promote a system of national education, and to obtain an extension of the franchise. Only very slowly could the leaders induce the unions to take any corporate part in politics. At the 1874 election there was something of a trade-union movement, and Macdonald and Burt were returned to Parliament, where the latter has since continuously sat.

Meanwhile the trade-unions were growing steadily in organization. Between 1858 and 1867 local federations of the branches in all the principal towns were formed, under the name of trades councils. The first of these seems to have been that of Liverpool in 1848. By 1860 they were common. The London Trade Council was established in 1861. Out of these councils came the trade-union congresses, now the great British parliaments of labor. An important special conference was held in London in 1864. The first annual conference was held at Manchester in 1868, and after 1875 became a power. What political action was taken by trade-unionists at this period was usually under the name of Radicalism or Liberalism. This grew up naturally as a result of the efforts on the part of the union leaders to gain legal recognition for their unions. It was necessary to use arguments that would appeal to middle-class politicians, since the Conservatives were not yet progressive enough to in-dorse trade-unions in any form. The argument that most appealed to the middle-class politicians was the Liberal argument of the freedom of the individual to sell his labor as he pleased—if he wished, individually; if he wished, collectively.

Congresses

At the general election of 1874 Alexander Macdonald (*q. v.*) and Thomas Burt (*q. v.*) were elected to Parliament from Stafford and Morpeth—the first labor members; elected as Liberals or Radicals, tho not with any cordial assistance from the Liberal Party organizers. Seventeen other labor candidates went to the polls at this election,

and the miners, iron-workers, and some other unions voted money for campaign expenses. It was this showing of the strength of labor at the polls which made the victorious Conservative Party in 1875 pass the bill finally legalizing labor combinations.

The last period, beginning about 1880, has seen a change. This has been marked by the appearance of the so-called new unionism. (For

New Unionism

a full account of this, see **NEW UNIONISM**.) It may be described in brief as the effect of recent English socialism on the trade-unions. The new socialism which began to appear about 1882 made some of the younger men, like Tom Mann and John Burns (*q. v.*), dissatisfied with the conservative and non-political methods of the older unions. The great dock strike (*q. v.*) of 1889 and the match strike, together with the London agitation of the unemployed, created wide-spread excitement, and enabled the younger leaders to organize a union of unskilled laborers, some of which (such as the Gas-workers and General Laborers' Union and the Dock and Wharf Laborers' Union) have maintained their existence.

Political Activity

The outstanding feature of the trade-union movement in Great Britain since that date has been its growing participation in political activity and the consequent establishment in Parliament of an independent "Labor Party," claiming to oppose all other political parties. Toward the formation of such a party there have been many contributory causes, not the least of which has been the constant efforts of the Socialists to arouse the English working men, and notably the persistent propaganda of the Fabian Society, which took form in 1896 in the establishment of a society called the Independent Labor Party, in which many trade-unionists were individually enrolled, and which has steadily increased in membership and in the number of its branches. But it was not until 1899 that the trade-unions themselves were induced to take action. Their adhesion in 1889-92 is to be attributed to the apprehension and resentment caused by certain legal decisions (culminating in the case of the Taff Vale Railway Company *vs.* the Amalgamated Society of Railway Servants, *L. R. Appeal Cases*, 426), by which the law courts brought trade-unionism once more under the ban of the law. No attempt was made to bring back the criminal prosecutions of trade-unionists. But the judges held, contrary to the universal opinion of lawyers since 1875, that, altho trade-unions were not fully incorporated, they could be sued and cast in damages for the action of their agents, whenever this without justification caused damage to other persons. Under this finding the Amalgamated Society of Railway Servants had to pay \$150,000 in damages to the railway company against which its members, against the wishes of the executive committee, had tumultuously struck. It became clear that trade-unionism was once more in grave danger from the law. The Trade-Union Congress had already taken alarm while the case was in the lower courts and in 1899 had issued an invitation to trade-unions, trades councils, and Socialist societies to join together in the formation of a "Labor Representation Committee" (*q. v.*). At the first annual conference of this committee in Feb., 1901, there were rep-

resented forty-one trade-unions with 353,070 members, seven trades councils, and the Fabian Society, the society called the Independent Labor Party (the *I. L. P.*), and the Social Democratic Federation. The latter organization soon withdrew, but the others continued, and at the sixth annual conference in 1906 there were represented 921,280 members in 158 trade-unions, seventy-three trades councils, the "Independent Labor Party," and the Fabian Society. This conference followed upon a most remarkable series of successful candidatures at the preceding General Parliamentary Election. The Labor Representation Committee had indorsed fifty candidates who had signed its pledge to constitute an independent labor group with its own whip, and of this number twenty-nine were elected. In addition to these members of Parliament, the miners' associations, which were not affiliated with the Labor Representation Committee, elected eleven members, and there were fourteen other workmen elected either as independent labor men or through the indorsement of other parties. The total labor representation in Parliament is therefore fifty-four. A striking feature of the ministry formed by the Liberals was the elevation of John Burns, the leader of the new unionism of 1889, to the position of a cabinet minister and president of the Local Government Board. Tho Mr. Burt and Mr. Broadhurst had held subordinate offices in previous Liberal ministries, Mr. Burns was the first workman to enter the cabinet. Tho this really amounted to a valuable recognition of the political influence of the working classes, the action of Mr. Burns in remaining outside the Labor Party, and in accepting office in a Liberal cabinet, was bitterly resented by the more extreme members of the Labor Party.

While the British unions were thus moving into the political field, they were not neglecting to strengthen their organization in the industrial field. The Trade-Union Congress had never taken on itself the support of unions in time of trade dispute. To accommodate these unions which desired a national body of this type, there was organized in 1899 the General Federation of Trade-Unions. The objects of this Federation were simply the accumulation of a strike fund for the assistance of constituent unions in strikes approved by the managing committee. Many unions were already affiliated in federations of their own, such as the Federation of Engineering and Ship-building Trades, the several miners' federations, and those of the textile trades. The General Federation affords similar protection for other unions, and even to unions which also are affiliated to the federations of their own industries. Its membership the first year included forty-three societies with 343,000 members, and had increased in 1907 to 119 societies with 630,933 members.

The recent statistics of British trade-unions are given in the fifteenth Report of the Labor Department of the British Board of Trade. The

Statistics

Department knew of the existence of 1,148 separate workmen's trade-unions at the end of 1904, with a total membership of 1,866,755. This is a decline in membership of 74,119, or 3.8 per cent, from the high-water mark at the end of 1901. The number of unions declined from 1,239 in 1901 to 1,148 in 1904. The total number of trade-unions has steadily decreased since 1896, when the number had reached 1,302. This de-

cline is especially marked in the smaller unions of builders and general laborers, where the process of absorption and amalgamation is most rapid.

Financial details are given with regard to 100 principal unions only, but these unions include over 60 per cent of the total membership of all the societies. The income of these 100 unions was £2,097,470 in 1904, and their expenditures amounted to £2,042,165. Their accumulated funds amounted to £4,616,230, or nearly £4 2s. per member. These figures are the highest yet recorded. "Of every £1 spent by the 100 unions in 1904, 6s. 4d. was for unemployed benefit, 1s. 3d. was on account of disputes, 8s. 4d. for sick, accident, superannuation, funeral, and other benefits, and 4s. 1d. for working and miscellaneous expenses." The proportion of expenditure for unemployed benefit was greater, and the proportion of expenditure for dispute benefit was less, in 1904, than in any year of the preceding decade. Meanwhile the accumulated funds have much more than doubled.

Detailed particulars as to the chief items of expenditure for the 100 principal unions are shown in the following statement:

EXPENDITURES, ETC., OF 100 PRINCIPAL TRADE-UNIONS, 1904

| ITEMS | Amounts | Percent |
|----------------------------------|----------|---------|
| Unemployed, etc., benefits | £647,722 | 31.7 |
| Dispute benefit | 126,446 | 6.2 |
| Sick and accident benefits | 384,519 | 18.8 |
| Superannuation benefit | 267,396 | 13.1 |
| Funeral benefit | 95,644 | 4.7 |
| Other benefits and grants | 103,234 | 5.1 |
| Working and other expenses | 417,204 | 20.4 |

Concerning the distribution of members by trades in the United Kingdom, the department furnishes the simple totals from which the following table is drawn:

| TRADES | GREAT BRITAIN | | | |
|---|-------------------|---------------------|----------|------------|
| | Registered unions | Unregistered unions | Branches | Membership |
| Metal, engineering, and ship-building | 108 | 129 | 2,778 | 335,908 |
| Building | 79 | 30 | 3,310 | 225,481 |
| Mining and quarrying | 50 | 19 | 2,197 | 501,248 |
| Textile | 66 | 182 | 519 | 221,694 |
| Clothing | 19 | 17 | 591 | 58,525 |
| Printing, paper, and allied trades | 22 | 19 | 387 | 62,428 |
| Woodworking and furnishing | 42 | 57 | 633 | 39,571 |
| Chemical, glass, pottery, etc. | 13 | 28 | 129 | 15,278 |
| Food and tobacco | 10 | 17 | 286 | 17,294 |
| Workers in fiber, cane, etc. | 5 | 10 | 116 | 4,443 |
| Leather | 13 | 15 | 84 | 6,247 |
| Enginemen | 15 | 10 | 187 | 10,567 |
| Miscellaneous | 30 | 16 | 1,187 | 49,941 |
| General labor | 16 | 2 | 1,013 | 97,676 |
| Transport (land and sea) | 46 | 11 | 1,380 | 154,206 |
| Agricultural laborers and fishermen | 4 | 3 | 9 | 3,913 |
| Employees of public authorities | 12 | 33 | 1,408 | 62,335 |
| Total | 550 | 598 | | 1,866,755 |

TREVOR, JOHN: Founder of Labor Church; born Liverpool, Eng., 1855. Sent to a Wisbech school, he grew up under a narrow orthodoxy, a crushing load on his imaginative spirit. In 1869 he was articulated to an architect in Norwich, but gave more thought to theological and sociological problems. In 1877, broken in health, he went to Australia, thence to San Francisco, and then entered the Meadville (Pa.) Theological School, to prepare for the Unitarian ministry. Returning to London, he tried to preach, but thought he had no mission, and returned to his profession of architecture in the south of England. Finding his profession commercialized and degraded by competition, he studied social problems more than ever, and gradually worked out the views which he later embodied in his Labor Church. Studying for a year at Manchester, New College, he then went to London to assist Mr. Wicksteed at Little Portland Street Chapel, but in 1890 went to Upper Brook Street Free Church, Manchester; at last left all organized churches and started, Oct., 1891, the Labor Church movement. (See LABOR CHURCH.)

TRUEBLOOD, BENJAMIN F.: Editor of *The Advocate of Peace*; general secretary of the American Peace Society; born Salem, Ind., 1847; educated in district schools, Friends' Academy at Blue River, and graduated from Earlham College, 1869. A.M., Earlham College, 1875; LL.D., Iowa Wesleyan University, 1887; LL.D., University of Iowa, 1890. Was in turn principal, instructor, professor, at various important institutions of learning; and from 1874-79 president of Wilmington College, Ohio; 1879-90 president of Penn College, Iowa. Spent year 1890-91 in France and other countries of southern Europe, studying the military condition of Europe. In 1892 was made general secretary of the American Peace Society and editor of *The Advocate of Peace*, which position he has held for fifteen years; has lectured in this country, England, and France. Member of the International Peace Bureau, Switzerland, and International Law Association. Early in life made a minister by the Friends' Society, he has been connected with many of the advanced religious movements in the Society of Friends. Mr. Trueblood holds advanced views on the subjects of peace and arbitration, temperance, women's rights, international trade, municipal ownership of street-railways, etc. Author of "The Federation of the World," and a number of pamphlets on peace. Translator of Kant's "Perpetual Peace." Address: 31 Beacon Street, Boston, Mass.

TRUSTS have been defined, both in their looser and stricter sense, by Mr. S. C. T. Dodd, solicitor of the Standard Oil Company, as follows ("The Present Legal Status of Trusts," published in the *Harvard Law Review*, Nov., 1893):

The term "Trust" in its more confined sense embraces only a peculiar form of business association effected by stockholders of different corporations transferring their stocks to trustees. The Standard Oil Trust was formed in this way, and originated the name "Trust" as applied to associations. . . .

The term "Trust," although derived as stated, has (now, however) obtained a wider signification, and embraces every act, agreement, or combination of persons or capital believed to be done, made, or formed with the intent, power, or tendency to monopolize business, to restrain or interfere with competitive trade, or to fix, influence, or increase the prices of commodities.

In this larger sense, which to-day usage has made the correct sense, a very large number and a considerable variety of associations must be included. Perhaps no recent economic movement has arrested more attention since the foundation of the first trust, the great Standard Oil Trust, in 1882, than the development of the trust movement. Mr. H. W. Macrosty, in his "The Trust Movement in British Industry" (1907), divides trusts into three main classes: the vertical or integral, as in the iron and steel industries; the more common amalgamation or horizontal combination, as more or less developed in all industries, and the innumerable but less organized terminable associations and agreements of the retail trades. Some trades pass through all these stages, beginning with a mere agreement as to prices, passing on into an association (sometimes into a trust in its narrowest sense), and then into a full consolidation of interest and management, and these general classes are subdivided into innumerable kinds and varieties, varying in different states and countries and from time to time to fulfil or get around the requirements of different laws, and varying also interminably with the needs of different trades and markets. Yet through them all runs the central idea, the avoidance of commercial competition and the development of more or less of a monopoly. Mr. Moody, in his "The Truth About the Trusts," perhaps the most authoritative recent statement of the facts as to trusts in the United States, considers them inevitable. He says (p. 494):

Instead of the growth of the trust movement being an achievement to be laid at the door of Mr. Morgan or Mr. Rockefeller, or any other leader of men, it should be laid at the door of nature. For if anything in this world is true, the following proposition is:

"The modern trust is the natural outcome of evolution of societary conditions and ethical standards which are recognized and established among men to-day as being necessary elements in the development of civilization."

As to statistics for the U. S., Mr. Moody, in Jan., 1908, brought his figures down to date as follows:

THE GREATER INDUSTRIAL TRUSTS¹

| NAME OF COMPANY | INCORPORATION | | No. of plants acquired or controlled | Total capitalization, stocks and bonds outstanding (par value) |
|--|---------------|-------|--------------------------------------|--|
| | Date | State | | |
| 1. Amalgamated Copper Co. and affiliated corporations..... | 1889 | N. J. | 35 | \$271,163,000 |
| 2. American Smelt. & Refin. Co. and affiliated corporations..... | 1899 | N. J. | 145 | 203,100,000 |
| 3. American Sugar Refining Co. and affiliated corporations..... | 1891 | N. J. | about 60 | 160,000,000 |
| 4. American Tobacco Co. and affiliated corporations..... | 1904 | N. J. | about 200 | 324,309,900 |
| 5. International Merchant Marine Co..... | 1902 | N. J. | 6 | 176,325,705 |
| 6. Standard Oil Co. and controlled companies..... | 1899 | N. J. | about 400 | 98,338,300 |
| 7. U. S. Steel Corporation and controlled properties..... | 1901 | N. J. | about 792 | 1,475,201,849 |
| Total (seven greater industrial trusts)..... | | | 1,638 | \$2,708,438,754 |

The "total capitalization" includes the stocks and bonds afloat (in the hands of the public) of all subsidiary or controlled corporations, as well as those of the parent company. The figures given are the par values. It must be clearly understood that in some cases both the number of plants acquired and the amount of stocks and bonds outstanding are only approximately correct. There are instances in which it is practically impossible to secure the accurate figures for both of these items. However, the greatest care has been used in arriving at these approximate figures.

| | No. of plants acquired or controlled | Total capitalization, stocks and bonds outstanding |
|---|--------------------------------------|--|
| <i>Summary of Industrial Trusts:</i> | | |
| 7 Greater industrial trusts..... | 1,638 | \$2,708,438,754 |
| 451 Lesser industrial trusts..... | 5,038 | 8,443,175,000 |
| <i>Grand Totals of Industrial Trusts:</i> | | |
| 458 Important industrial trusts..... | 6,676 | 10,951,613,754 |

None of the above capitalization figures are duplicated. They represent, not the amount of securities authorized or even issued, but simply those which are "afloat" or in the hands of the public. No securities of subsidiary corporations which are owned by the controlling corporations are included in these figures.

| | | |
|---|--------|------------------|
| Totals of the franchise trusts..... | 2,599 | \$7,789,393,000 |
| Totals of the great steam-railroad groups..... | 745 | 12,931,154,000 |
| Totals of all franchise and transportation trusts..... | 3,344 | \$20,720,547,000 |
| Grand totals (Jan. 1, 1908) of all trusts—industrial, franchise, transportation, etc..... | 10,020 | \$31,672,160,754 |

An analysis of these figures slightly in detail would show that of the industrial trusts 15 have \$100,000,000 capitalization or over, 33 have \$50,000,000 or over, 165 have \$10,000,000 or over, and 451 have \$5,000,000 or over. Of the franchise trusts 16 exceed \$100,000,000, 41 exceed \$50,000,000, and 156 exceed \$5,000,000. Of the 6 greatest railroad groups, all exceed \$1,000,000,000 capital.

EVILS

Trusts are accused of every economic evil, but probably with much injustice and certainly with much exaggeration. As to raising prices, the conclusion Professor Jenks, one of the most careful students of trusts, arrives at is probably the opinion of most. He says:

While they have it in their power to make profits at somewhat lower rates of prices than would be possible under free competition, they nevertheless do probably check slightly the normal decrease in prices that comes with increasing facilities for manufacturing. At any rate, they hold prices so that they can make much better profits than under competition. Competition, however, and the checked demand that would come with too high prices, generally in the long run prevent prices from being much higher than under free competition.

As for the treatment of employees, generally speaking, monopoly at least makes possible, and probably usually makes actual better conditions. Generally speaking, wages are higher and treatment of employees better with large companies than with small ones. Small competing firms are often driven to small wages for lessening the cost of production. Large companies usually find fair treatment of employees the cheapest. They have capital to introduce reforms which small companies, tho anxious to, often cannot. Above all, combination of interests makes possible and

¹ In this list the "number of plants acquired or controlled" embraces not only the corporations and plants now operating, but also those which operated previously to their acquirement, whether they have now been discontinued or not.

often even necessitates collective bargaining, aiding often and making necessary often strong trade-union organization. Strikes have occurred on the part of employees to compel small employers to enter an employers' association. Nevertheless trusts also make possible and often actual centralization of power used to crush out trade-unionism. A greater evil is their control of the methods and channels of production. They can and continually do discriminate against the home market, or certain sections which are under their power, by raising prices there to recoup themselves for selling cheap in a competitive foreign market or to create new trade. They frequently prevent progress by being able to prevent inventors from putting their inventions on the market, through not having or being able to get capital enough against these gigantic combinations. They often absolutely and irresponsibly check or destroy personality and free individuality. The one great evil of trusts and monopolies is their scandalous and notorious defiance or corruption of government. But for this see CORRUPTION. It is not, however, confined to the U. S. Said *The Economist* (English), Aug. 12, 1899: "It is undeniable that during the session just ended there has been an atmosphere of money in the lobby, and presents to the House of Commons scarcely known before. All manner of 'interests' have gathered there as they gather in Washington and in the various state legislatures in America."

The danger of the trusts then is that they threaten personal liberty, that we shall become, as has been said, "a nation of industrial and commercial employees practically permitted to enjoy life in greater or less degree, by the permission of other employees, who will take their instructions from the small companies of captains of industry who promise, in time, to be in control of the necessities, as well as the luxuries, of life, their production and distribution."

REMEDIES

Almost every state in the U. S. and the federal government in two main bills has attempted legislation against trusts. Yet the movement has only gone on increasing. When the Standard Oil Trust was declared illegal in Ohio, it continued with even greater powers under a new name, while its connections, assuming different names in different states to avoid the law, virtually form a single body. So, to a less extent, with the other trusts.

The first general federal law which can be regarded as a result of the trust agitation was the Interstate Commerce Act passed in 1887. This act was the outgrowth of the sentiment which had been created during the previous years by the general cutting of rates by the railroads, and their inequitable dealings with shippers in all parts of the country. The relations of the railroads with the Standard Oil Trust were matters of particular criticism at this time, and the immediate purpose of the act was mainly to eliminate the illegal discriminations in favor of the Standard, and, if possible, give all shippers the same opportunities.

The Interstate Commerce Law has now been in existence for twenty years, but its results have in no way verified the predictions of its framers. Recently its powers have been largely widened and prosecutions against the Standard Oil monopoly trusts have been begun, and several have been successful to the extent of imposing fines running into many millions. But these have been usually subject to appeal to Supreme Court, while few believe they can break up the movement.

A measure which was created in 1890, and is popularly known as the Sherman Antitrust Act, is the law which was passed for the express purpose of eliminating monopoly in

railroads or other corporations which may become established "in restraint of trade." It is the law under which the Northern Securities Company was sued by the Attorney-General of the U. S. and declared illegal. The law declares unlawful every contract, combination, or conspiracy in restraint of trade or commerce among the several states or with foreign nations; and also declares unlawful monopolies, and any attempt to monopolize, or any combination or conspiracy to monopolize any interstate or international trade. The law has been in effect now fifteen years and, with the exception of the Northern Securities Company case, has accomplished, at least until recently, practically nothing. Of the final result of the recent prosecutions it is too early to speak definitely. Most of the great trusts, however, have been formed since the passage of the law, and in spite of it, and most publicists believe that while perhaps some of the more apparent and grosser violations of the laws may be prevented by such legislation, the essence, if not the necessity of trusts has too deep a foundation in economic interest and practical common sense to be permanently and seriously affected by such laws. Colossal industries cannot by law be compelled to compete, only prevented from continuing in certain ways.

Therefore most publicists believe, with individualists, that the trusts must be attacked in their foundation, by taking from them all special privileges (see INDUSTRIALISM; FREE TRADE), or with the Socialists, that the trusts are but stepping-stones to socialism, the great trust of the people.

OTHER COUNTRIES

The trust movement in other countries has gone by no means so far as in the U. S., and has assumed less sensational forms, and yet very actually exists. Mr. Macrosty, whose two books, "Trusts vs. the State" (1901) and "The Trust Movement in British Industry" (1907), furnish probably the best general study of the subject in Great Britain, finds the trust movement, at least in the form of agreements to control prices, more or less present in practically every British industry. The movement in Great Britain is scarcely twenty years old, and as it

Great Britain has not developed in the striking American form and since some of the early attempts at combination were not a success, the claim has been made that trusts cannot flourish on British soil, nor under free trade, yet Mr. Macrosty says of England ("Trusts vs. the State," p. 160): "So far as the transport services are concerned, we are driven to the conclusion that competition in the old sense of the term has ceased to exist; and turning to manufactures proper, we shall find the same opinion forced upon us."

The first movement to consolidation was, as was to be expected, among "the natural monopolies" dependent upon valuable franchises, such as the agreement between the London Water Companies after they were forbidden to amalgamate and before they were bought out by the city. The next step was in the development of "throughness" on the railways, such as the formation of the London & Northwestern Company out of forty-five companies, and the amalgamation of the Southeastern and the London, Chatham, and Dover Railways. To-day there is practically no competition in British railways (see RAILWAYS), fares being fixed by conferences between the roads. Shipping companies have similarly combined. Charges here too have almost invariably been fixed by conferences between the lines.

Combination in manufacturing lines is more recent; after various failures, beginning successfully about 1895, in the metallic bedstead trade in Birmingham and rapidly extending to many other industries in Birmingham and

elsewhere. Combination in the textile trades began about the same year in the textile industries with J. I. Coates, Limited, in the sewing-cotton trade. In 1896 London found that eight firms supplying 5,000,000 of the 8,000,000 tons of coal coming to London, had combined. Agreements as to prices are at present the rule in the iron and steel industries. Amalgamation and absorption of companies in every branch of industry goes steadily on. Says the *Textile Mercury*, as early as April, 1899: "Steadily, altho at a rate far less rapid than in the States, amalgamation of kindred concerns is going on within our borders." In almost every case, says Mr. Macrosty (*idem*, p. 199):

Years of keen rivalry have eaten away all the gain in manufacturing or trading. Attempts to reconcile the conflicting interests have produced some form or other of voluntary association to control selling prices; but these bodies, even when guarded by the provision of money penalties for breach of rules, may at any time be wrecked by the greed of one member or the starting of a new competitor. Sooner or later they break down and the trade either slips back into the slough of bankruptcy or advances to the consolidation of rival firms into one large company.

In Germany similar combinations (called Kartells) have arisen in the last twenty-five years, often of great power and magnitude, and in a great number of trades. In the extent to which actual merging of companies has gone they occupy somewhat of a midway position between the developed American trust and the English agreement. The specific and typical

Germany

German kartell (tho the word is also used in a looser sense) is not a merging of companies, nor yet a mere agreement, but the formation of a committee and sometimes of a new company which undertakes the selling (and therefore the fixing of prices) for all the companies entering into the kartell. The companies do not sell at all, and are wholly independent only in methods of production. To this simple beginning, however, greater powers are often added, and the kartell is recognized by the German law and both defended and made responsible by the law. Kartells of one kind or another exist in the coal, iron, steel, book, wall-paper, and spirit industries; to a less extent among others. One of the chief is the Rhenish Westphalian Coal Kartell, with a capital of only \$225, but all of the shares are held by the coal owners and are transferable only with the consent of the general meeting, so that the coal owners wholly control it and through it determine the output, the base price, and the selling price, each mine owner voting according to the number of tons of coal he produces.

Similarly under one form or another, tho to a less extent, the trust movement has developed in France, Belgium, Austria, and elsewhere.

TUBERCULOSIS: The definite movement for the prevention of tuberculosis dates from the discovery of the tubercle bacillus by Dr. Robert Koch, of Berlin, in 1882. Koch not only found that this bacillus is the cause of the disease but was able to isolate and describe the life history of the organism. He proved that it is received into the body in a dried state through the discharges of tuberculous individuals and chiefly through the sputum. The main channels of infection are the respiratory and digestive tracts.

It follows from Koch's discoveries that tuberculosis is necessarily an infectious disease, and, its cause being known, is consequently preventable. It has also been found by subsequent clinical investigators that when taken in its early stages the disease is curable.

While it was some years before the significance of Koch's work became generally recognized, there has now arisen a movement for the elimination of tuberculosis of world-wide scope. The necessity for this organized campaign is evident from the extent of the disease which is responsible for more than 1,000,000 deaths per annum in the civilized world.

The conditions which favor the development of tuberculosis are precisely those which exist in the crowded quarters in each of our great centers of population where the nutrition of the inhabitants is defective and where adequate ventilation and hygienic surroundings are not present. The practical work of prevention therefore associates itself with all the modern movements of a social character for the betterment of the poorer classes of our communities. It involves the cooperation of the medical profession and the laity as well as the vigorous prosecution of measures for the betterment of health on the part of public officials.

Starting in Europe, the organization of leagues for the prevention of tuberculosis has spread rapidly until at the present time such associations are found in nearly all the countries of the civilized world, those of particular efficiency being in Great Britain, Germany, France, Denmark, Switzerland, and the United States. Organizations on national lines also exist in Italy, Austria, Belgium, Spain, and Portugal.

Extent of Movement Against

In Norway the government is taking an active part in the control of tuberculosis, and the same is true, in a lesser degree, of Sweden.

In South America antituberculosis leagues exist in Brazil, Argentine; Chile, Uruguay, Paraguay, Bolivia, and Ecuador. A league has also been established in Cuba.

In the U. S. the National Association for the Study and Prevention of Tuberculosis is pushing the work of organization in all parts of the country. There are now seventeen state societies for the prevention of tuberculosis, with others in process of formation. Local associations to the number of about eighty have also been organized, nearly all within the last two years, and it is evident that a short time will see the U. S. completely organized for the fight against this disease.

An International Antituberculosis Association made up of representatives from the various national societies is also in existence with headquarters in Berlin. Annual meetings are held where topics of particular interest at the moment, both technical and social, are discussed from the various points of view of the different countries represented.

Once every three years an International Congress of still wider scope is held and is rapidly becoming one of the chief factors in the dissemination of authoritative information regarding tuberculosis and its treatment and prevention. The next congress will be held in Washington in Oct., 1908.

The most important feature of the organized campaign as at present conducted is the movement for the education of the general public with regard to the causes of tuberculosis and the methods of prevention.

Methods While every available means is drawn upon to force this knowledge upon the attention of the public, particular emphasis has been laid during the last two years upon the exhibition method. Such exhibitions of comprehensive character form one of the chief features of the international congresses, and in the U. S. exhibits are kept constantly in operation in various parts of the country. The National Association conducts one of large size which is sent from city to city, and is used as a means of stimulating public interest and subsequent organized cooperation against the disease.

Permanent exhibits have also been formed by many of the state and local societies.

The program advocated by those who are conducting the campaign is comparatively simple in its outlines. It involves the establishment of sanatoria, hospitals, dispensaries, etc., on an adequate scale for both incipient and advanced cases. This is regarded as necessary not only as a curative but as a preventive measure. It also advocates the passage of such legislation as shall enable the municipal and state health authorities to exercise adequate supervision over the disease. The particular points at present at issue are the requiring of registration and notification of tuberculosis by physicians and the passage of ordinances forbidding indiscriminate expectoration. The other features of the program can be included under the term "Education" which, as has been said, involves every possible method of instruction in the elementary facts regarding the disease, namely, that it is infectious, preventable, not inherited, and in early cases curable; that in order to prevent infection proper hygiene must be observed, and that the cure depends upon the simple factors of fresh air, good food, and rest. The reduction that has already taken place in the death-rate from consumption in those communities where rigid and organized measures have been taken make it entirely reasonable to suppose that the disease will ultimately be practically eliminated.

PROF. LIVINGSTON FARRAND.

TUCKER, BENJAMIN R.: Anarchist; born near New Bedford, Mass., 1854; educated in private schools, and at Massachusetts Institute of Technology; decided on journalism as a profession; served apprenticeship in printing-office; in 1878 joined editorial staff of a Boston newspaper. Introduced to radical thought by Josiah Warren, Colonel William B. Greene, and others. Making a thorough study of Proudhon, he considered "anarchism" to be the most appropriate designation for his political doctrines. In 1877 he established a quarterly, *The Radical Review* which did not receive the requisite support. Mr. Tucker soon concluded that a more effective propaganda of his views could be carried on by a fortnightly or weekly organ, and accordingly

founded *Liberty*, in 1881, still recognized in philosophic and progressive circles as the ablest and most authoritative champion of anarchism, both in Europe and America. In 1893 published "Instead of a Book"; in this socialism, communism, the single tax, and other reforms are criticized from the anarchistic point of view. Author: "A Blow at Trial by Jury"; "The Attitude of Anarchism Toward Industrial Combinations." Address: P. O. Box 1312, New York City.

TUCKWELL, GERTRUDE M. (MISS): Chairman of the Women's Trade-Union League; born 1862, Oxford, England; was educated at home; daughter of the Rev. William Tuckwell, "the Radical Parson," well known in England for his experiments in allotments, his advocacy of land nationalization, and his strong labor views. At the age of twenty in order to be independent she trained as a board-school mistress; worked in Liverpool and in London for six years. Then became secretary to her aunt, Lady Dilke, and honorary secretary to the Women's Trade-Union League, and came thus into complete touch with women's industrial life. At the death of Lady Dilke in 1904 was chosen in her place chairman of the Women's Trade-Union League. Through the league, which is very active both in trade-union and in legislative work, Miss Tuckwell represents 140,000 women. She is a Christian Socialist and a strong trade-unionist; has written much for the *Fortnightly* and *The Nineteenth Century*. Author: "The State and Its Children," and several small books on industrial law. Address: Women's Trade-Union League, Club Union Building, Clerkenwell Road, London, E. C.

TURGENEFF, IVAN SERG-YE-VITCH: Russian novelist, nihilist; born 1818 in Orel, the son of an officer of cuirassiers; he was educated at Moscow and afterward at the University of Berlin. In 1852 he first became the object of government displeasure. Was imprisoned for a month for an article he wrote on the death of Gogol, and compelled to reside for two years more in the country. This experience seems to have been in some sense a turning-point in his career, for in 1855 he commenced publishing the novels which have had such a vital connection with the social life of Russia. In 1855 he published "Dimitri Rudin"; in 1858, "A Nest of Nobles" and "Helene"; in 1862, "Fathers and Sons," which work was one of the most potent means in wakening into action the philosophy of negation and materialism. This book, too, gave to the philosophy the name of "nihilism," which it has borne ever since. In 1865 he published "Smoke," and in 1877 "Spring Floods" and "Virgin Soil." He wrote many shorter stories; his last work was a collection of prose poems entitled "Senilia," which for power and pathos takes rank with his best work. After the publication of "Fathers and Sons" he left Russia and settled in Baden, where he stayed until the termination of the Franco-German War. Then he removed to Paris and resided there until his death in 1883.

TURGOT, ANNE ROBERT JACQUES, BARON DE L'AULNE: French statesman and economist; born Paris, 1727. Educated for the Church, he gave up an ecclesiastical career and studied law, becoming noted as a liberal thinker and contributor to the *Encyclopédie*. He associated with

Quesnay and Gournay, and accepted to some extent their views. (See *PHYSIOCRATS*.) In 1761 he was appointed intendant-governor of the province of Limousin, and in 1774 Controller-General of France under Louis XVI. The courtiers and nobility bitterly opposed his reform ideas, but for a while the king supported him, and he was able to introduce free trade in grain and other reforms. At last the king, in 1776, was induced to depose him, and Turgot retired to private life and devoted himself to science till his death in 1781. His "*Œuvres Complètes*," including his essays on usury, on taxation, and "*Réflexions sur la Formation et la Distribution des Richesses*," etc., were published in nine volumes (1808-11).

TYPOGRAPHICAL UNION, THE INTERNATIONAL: The International Typographical Union of North America, organized in 1852 as the National Typographical Union, is the oldest national trade-union in the United States. As early as 1836 an attempt was made to unite the typographical societies in the U. S. in a national organization. At a national typographical convention held in Washington, Nov. 7-11, 1836, a constitution was framed and submitted to the various local societies. In 1837 at New York this constitution was amended in minor details and the National Typographical Association formed. The association, however, died within the year. In 1850 a call for a national convention was issued by the New York, Boston, and Philadelphia unions, and on Dec. 2, 1850, the National Convention of Journeymen Printers met in New York with delegates present from six unions located in five states.

History At the convention held in Baltimore in 1851 the unions in seven states were represented and the convention formulated a constitution for the National Typographical Union. In 1869 the name of the union was changed to the International Typographical Union of North America.

The membership of the union includes printers, proof-readers, machine-tenders, mailers, typefounders, editors, and reporters. Pressmen and bookbinders were admitted until 1895, stereotypers and electrotypers until 1902, and photoengravers until 1904. The members of these trades have formed separate international unions. Despite these losses, the membership of the Typographical Union has steadily increased in recent years.

The annual convention of representatives elected by the subordinate unions was originally the only organ of government. The officers, mere adjuncts to the annual session, were elected by the convention from its own members and held office for one year. Since 1884 the annual

meeting of representatives has been partly replaced and partly supplemented by other institutions. In 1889 the referendum was made a regular part of the union's governmental machinery. Provision was made that all amendments to the constitution and all laws involving increased taxation should be submitted to a vote of the membership. The advocates of nationalization in the union have long desired to replace entirely the convention by the initiative and referendum. In 1893

Government they secured the adoption of the initiative; in 1894 the sessions were made biennial; in 1896 the membership voted to do away with regular sessions. Since 1896, however, there has been a strong movement in the direction of limiting the use of the initiative and referendum and of restoring the convention to a considerable place in the governmental machinery. The annual session has been restored. A referendum is always had, however, on important changes of law. The initiative is rarely used. Since 1896 the officers have been elected by a popular vote and every member of the organization is eligible to office.

Since the establishment in 1888 of permanent headquarters, the importance of the official staff has rapidly increased. The judicial power of the convention has practically been transferred to the president. The increasing intricacy of the union's affairs has made the opinion of the officers more weighty in legislation. The net result of these changes is that the government of the union, theoretically vested in the convention, rests really in the membership at large and in the official staff.

In the fiscal year ending May 31, 1905, the receipts of the union were \$244,689.24. Of this sum \$196,280.27 was received from a per-capita tax of thirty-five cents monthly; \$27,472.83 was received from a compulsory subscription to the *Typographical Journal* of five cents monthly. Thus practically all the revenue of the union is derived from the regular per-capita tax and from special assessments.

The principal expenditures of the union in 1905 were: Printers' Home, \$56,235.95; burial benefits, \$39,690; the *Typographical Journal*, \$29,426.77; salaries and office expenses, \$16,408.02; strikes and disputes, \$39,603.16.

The United Typothetæ of America, the organization of the book and job master printers, was organized in Oct., 1887. It was formed primarily to resist the demand of the Typographical Union for a reduction of the working-day to nine hours. The bargaining between the United Typothetæ and the union has been concerned almost exclusively with the shortening of the working-day. In 1898 the Typothetæ agreed to put the fifty-four-hour week into effect on Nov. 21, 1899. In 1902 the Typographical Union began to plan for a further reduction in the hours of work. The Typothetæ has steadily refused to grant the eight-hour day. In Sept., 1905, a great strike began. The strike was at first confined to Chicago, but by Jan. 1, 1906, it had extended to every large printing center. The Typothetæ has led the opposition to the demand for the eight-hour day and has on its own side declared for the open shop.

The relations of the union with the American Newspaper Publishers' Association, the organization of employers in the newspaper business, have been amicable. In 1900 an arbitration

agreement was entered into by the union and the publishers. Under this agreement the Typographical Union guaranteed the performance of the contract of a local union with a publisher, provided the publisher agreed to arbitrate all disputes as to interpretation. In 1902 the agreement was broadened to cover not only disputes as to interpretation but disputes arising over the formation of new contracts. The present agreement expires in 1907. **GEORGE E. BARNETT.**

TYSON, ROBERT: Exponent of direct legislation and proportional representation; born Canterbury, England, 1845; largely self-educated; as a boy worked in machine-shop; later shorthand clerk in railway offices; then as newspaper reporter and editor in Lancashire. Came to Canada 1870; did newspaper work until 1876, when he was appointed stenographic reporter to the Court of Queen's Bench, now a division of the High Court of Justice. At one time editor of *Proportional Representation Review*; is now editor of the Proportional Representation Department in *Equity Series*, of Philadelphia. He has conducted many elections for societies, labor-unions, etc., and addressed meetings on the proportional principle; is in touch with the movement and current history of proportional representation in Great Britain, Australia, New Zealand, Belgium, Switzerland, etc. Mr. Tyson's economic views are based on those of Henry George, and for some years he worked ardently in the single-tax cause. Later becoming impressed with the necessity of improved political conditions in order to forward social reform, he directed his work more toward direct legislation and proportional representation, making a specialty of the latter. Author of several pamphlets and many serial articles on elec-

toral reform. *Address:* 10 Harbord Street, Toronto, Canada.

TWEED RING: The Tweed Ring of New York City may be said to have begun in 1863, when William Marcy Tweed, a chairmaker of Scotch descent, born in New York in 1823, was appointed deputy street commissioner. He had been long prominent in local politics, and in 1853 had been elected to Congress. He was a member of Tammany (q. v.) for many years, and from 1869-71 its grand sachein. Becoming the virtual head of the Street Department, and later of the Department of Public Works, he enormously extended the expenditures for "improvements," and created numberless offices, giving him vast influence and the bestowal of sinecures on his friends. A ring gradually developed, and by 1869 held almost every department of the city in its power. In 1868 the ring's greatest scheme of robbery was begun—the building of a new county court-house. It was stipulated not to cost over \$250,000. Before 1871 it had cost \$8,000,000, and was still unfinished. In 1870 the power of auditing accounts was taken from the supervisors and vested in certain city offices filled by friends of the ring. All restraints on fraudulent bills were then removed. Bills amounting to \$6,000,000 were passed at the first and only meeting of the Board of Audit. Of this amount \$1,000,000 was traced to Tweed's own pocket. A secret account of the money thus paid was kept in the auditor's office, entered "County Liabilities." During the winter of 1870-71 a clerk stealthily copied its items and showed them to his patron, James O'Brien, an opponent of Tammany. He gave them to the *New York Times*, and they were published in July, 1871. The excitement created an investigation, and through the efforts of Samuel J. Tilden the frauds were exposed and the ring overthrown in the election of Nov., 1871. Tweed was tried for grand larceny and forgery, and Nov. 22, 1872, sentenced to twelve years' imprisonment and a heavy fine. In 1875 he escaped and fled to Spain, where he was captured and returned to New York City in 1876, dying in Ludlow Street Jail in 1878.

U

UMANITARIA, LA SOCIETÀ: An Italian philanthropic society, founded by the generosity of Prosper Moïse Loria (died 1902), of Milan, who bequeathed 10,000,000 lire for this purpose. But owing to certain legal and political difficulties, the society has been inactive for nearly ten years, and the funds now amount to about 13,000,000 li.

The general purpose of the society is to help the poor, needy, and unemployed, to raise the industrial efficiency of workers, and to serve as a general adviser and cooperator to all philanthropic societies. Men and women of whatever nationality are admitted as members on payment of 1 li. per annum. The members elect fifty delegates who have general charge of the budget and of the management, and elect ten of the fifteen directors of the society—the other five are appointed by the Municipal Council of Milan.

The Umanitaria expects to have about 600,000 li. annual income, to be divided thus: 45,000 on

annuities; 90,000 on administrative and office expenses; 175,000, or 37.64 per cent, for the amelioration of unemployment; 200,000, or 43 per cent, for industrial education; 50,000, or 10.76 per cent, on farm laborers; 20,000, or 4.3 per cent, in the promotion of cooperation; 20,000 on social bureaus of all kinds which aid the poor and needy in some way, particularly legal and medical aid societies.

The society maintains a *Bureau du Travail*, for making investigations into various labor problems, e. g., legal rights of the workman, the opportunities for employment at home and abroad, institutions for the moral improvement of the working classes, cost of living, sanitary conditions, etc. This bureau has, with its three divisions, a network of correspondents all over northern and central Italy, and receives reports regularly. The employment bureau for working men, governesses, and domestics placed in 1906: industrial workers, 5,089; domestics, 602. Two

bureaus assist, instruct, and supervise emigrants both from the city to the country and from Italy to foreign lands.

Industrial education is furnished in schools of designing, blacksmithing, furniture-making, engraving, molding, decorating, varnishing, clock-making, tailoring, cooking, embroidery and other needlework, electricity, etc. One school is intended to train young men as foremen, superintendents, etc.

Cooperation is encouraged by a loan association, a supply store, an agricultural cooperative society, etc.

The unemployed are assisted, according to the system practised at Ghent, by a relief station and a labor colony.

The society has taken a keen interest in the housing of working men, and has established (1906) two model tenements for 2,000 persons at a cost of nearly 1,000,000 li. It has encouraged taste and simplicity by offering a prize for the best furnished flat for a small family at a cost below 700 li.

The espousal of anti-alcoholism and the establishment of a *Musée Sociale*—intended for the education of the people in preventive measures—complete the list of activities of the Umanitaria. The society expects to purchase an old monastery, renovate it, and establish its industrial schools, its central offices, and a physician for women there; and to build a *Maison du Peuple* in its neighborhood.

RUDOLPH M. BINDER.

UNEMPLOYMENT: We consider in this article: I. The meaning and kinds of unemployment. II. The number of the unemployed. III. The means used to meet the problem.

I. Meaning and Kinds of Unemployment

It is necessary to consider the meaning of the word, because differences here have led to numberless misunderstandings and to fatal errors in the practical working of the problem.

Mr. Carroll D. Wright, in his report on the unemployed as United States Commissioner of Labor in 1886, uses the word in a very limited sense. He defines it as including only "those who under prosperous times would be fully employed and who during the time mentioned were seeking employment." But, obviously, if during times of especial need one would find the complete number of those without work, one must add to those whom Mr. Wright defines as the unemployed, those who in times of prosperity would be without employment, and this undoubtedly is not a small number.

Other writers seem to mean by the term only those who desire work. The tramp who does not work, mainly because he will not work, they do not reckon among the unemployed. The object of making this distinction seems to be to differentiate between those whom people consider to deserve sympathy and aid in finding work and a class which they believe to be very much to be condemned and who should be severely treated. Yet if we could go into the life history or the prenatal history and early environment of the work-shunning tramp we might find one genuinely to be pitied even more than the man who has not yet fallen low enough to lose his desire for work, one perhaps needing aid and help (altho usually in the form of very stern treatment) more than any other one class

in the community. But however this be, it is certainly true that no one can possibly arrive at any true conclusions of how to employ the unemployed, if one leaves out of consideration those who do not desire employment. For in actual life those who do not work because they cannot find work and those who do not work because they will not, are commingled at every step and not seldom the two natures are somewhat developed in the same person. The whole problem of employing the unemployed often turns upon this very point. One cannot solve a problem by reading out of the problem one of its most difficult and complicated factors.

Once more, some writers and more readers seem to understand by the unemployed only the exact opposite of the foregoing. They take it for granted that any can find work who will, and that therefore if anybody is without work, it is because he will not work, or at least because of some fault which he has developed, and for which he is morally responsible. To them there are no unemployed except those who will not work. Few students of social facts take this view. However much the members of the unemployed through no fault of their own may have been exaggerated by some, no one can doubt but that, in the present ordering of society, with its sudden economic changes, there are such. The invention of a machine, the formation of a trust, the usual resultant shutting down of mills or shops or mines, the change of a railroad rate, the termination of an important contract, the

Analysis

failure of some crop or of some supply, even the caprice of fashion or the overstocking of a market—these and a hundred other things may cause thousands of operatives to be at least temporarily out of work. To call all the unemployed willing idlers, or shiftless incapables, is to ignore facts and to insult many a worthy but unfortunate honest workman. It certainly is to dodge rather than to face a problem.

Nor is there any more ground for limiting the word unemployed, as is sometimes practically done, to the unemployed among the artisan and manual-labor class. The unemployed clerk, the unemployed accountant, journalist, professional man, is often in a much more serious and critical condition than the artisan or manual laborer who finds himself without work. A university diploma is unfortunately by no means an insurance against lack of work.

Nor, once more, can the term unemployed be limited to those who are without work for a considerable period of time. An artisan without work for a day is not usually in a very serious condition and certainly need not be a concern to the community, and yet he is for that day unemployed. He may in that day contract the beginnings of evil habits; he may that day undercut the wage of a man who will go months without work—above all, if day be added to day, he may grow, before he knows it, and before the community knows it, into one who is both a burden and a menace to the community. This is certainly true—that if provision for those finding themselves temporarily out of work can be made promptly and well, before habits of idleness and the recklessness of discouragement have set in, the difficulty of caring for confirmed idleness, hopeless apathy, and developed degeneration will often not have to be met. It may be said in fact that almost the most important portion of the

problem of unemployed is how to prevent there being such a person as an unemployed man.

Nor finally is there any sex limitation to the word. An unemployed man may, in the long run and upon the whole, be a very much more serious social factor than an unemployed woman, because usually and as a fact to-day, and as most people believe, by nature, man is the chief bread-earner of the family and of the community; but when a woman does need work and either cannot or will not find it, she is often in a much more pitiable, and a more dangerous, even desperate condition than an unemployed man. The problem of the unemployed cannot leave out the woman idle either by disposition or by circumstance.

And so we must mean by unemployment the being out of work, for any cause, either by fault or misfortune, by any class or condition of persons who are in need of work, whether conscious of the need or not.

Definition

But second only to the necessity of including in the problem all its elements, all classes of the unemployed, is the necessity in the actual treatment of the case to most carefully distinguish and discriminate between different classes of the unemployed. The failure to do this last has probably been the one most frequent cause of the failures in working out the problem. To treat a drunken, burned-out weakling like a strong skilled man, temporarily out of work, is almost as serious a sociological mistake as to treat the honest, skilled, willing artisan, out of work, like the tramp who comes begging for a nickel to quench his fevered thirst. Yet history is full of instances of industrial colonies which have failed because they have taken for granted that everybody knew how and desired to work, and still more of instances of well-meant systems which have begun by insulting or more frequently driving away the most hopeful class of the unemployed by insulting them and lumping all the unemployed in one class and under conditions suited only to the most degraded and the most inefficient. To distinguish is the very first step toward the solution of the problem. Years ago it was said by John Burns, the present Secretary of the English Local Government Board:

Until the differentiation of the laborer from the loafer takes place, the unemployed question can never be properly discussed and dealt with. Till the tramp, thief, and ne'er-do-well, however pitiable he may be, is dealt with distinctly from the genuine worker, no permanent benefit will result to any of them. The gentleman who gets up to look for work at mid-day, and prays that he may not find it, is undeserving of pity. I have seen the most genuine and honest men at meetings mixed up with the laziest and most drunken scoundrels.

Briefly, we may divide the unemployed as follows:

First, The Temporarily Unemployed, who are Employable—those who, both able and willing to work, find themselves for one reason or another temporarily out of employment.

Second, The Temporarily Unemployed who are Unemployable—those who for one reason or another, of fault, or of temperament, or circumstance, are so inefficient that while they can do certain work, are always losing their jobs, continually getting the not remaining permanently out of work.

Third, The Somewhat Permanently Unemployed who are Employable—those who by reason of a change in their trade or in the market, or for some other reason find themselves threatened by permanent

unemployment and yet are able and willing to work.

Fourth, The Permanently Unemployed and Unemployable—those who are permanently out of work, because for one reason or another of fault or misfortune they are too inefficient to do work.

Fifth, The Permanently Unemployed who are viciously or incorrigibly unwilling to work.

It is obvious that these distinctions at once need very different modes of treatment. Differentiation only can lead to solution.

II. The Number of the Unemployed

Before considering their number it is necessary to consider some common misconceptions of the subject.

The opinion seems general in the U. S., and to a less extent exists even in other countries, that the number of unemployed has been exaggerated and above all that sympathy for men without work is, generally speaking, largely undeserved. The reasons for this very common and natural opinion are habitually overlooked, but when they are studied the opinion will be seen to be erroneous.

1. In the first place, the unemployed which come into closest contact with the general community, and above all with the charitable community, are beyond all question the worst unemployed and therefore mislead the public as to the general character of the unemployed. The self-respecting men and women avoid begging and knocking at the doors of charity until the last possible moment. Many of them prefer and often actually do choose starvation rather than beggary. Consequently these self-respecting persons are the last to come in evidence before the charitable. But those who have lost self-respect, who will not work even when they can, who are the professionally unemployed, the typical tramp of the stage and at the rich man's door—these do continually haunt the wealthy and the charitable. Not unnaturally the ordinary public judges from its experience and wrongly concludes that what is true of the unemployed with which it comes in contact, is true of the whole class, and that the one trouble with the unemployed is that they will not work. But all experienced investigators of the subject are agreed that, while this may be true of a large class, it is by no means true of all, and that there are millions of people in the U. S. who never come before the charitable and who even denounce and dislike charity who are nevertheless, at least for periods of time, bitterly in need of work.

2. These premature judgments of the ordinary public are caught up and repeated by the press. The press, and especially the press supporting whatever administration happens to be in power in any locality, Republican or Democratic, does not like to admit any lack of employment. It is for their interest to talk good times: "Prosperity" talk creates prosperity. Of this there is no question. Desiring, as we all do, prosperity, the papers, probably rightly, encourage hope, but not unfrequently falsely assert that there is work for all. A New York paper not long ago declared that the Department of Street Cleaning was unable to secure street-sweepers. Application at the department at that very time elicited the fact that the department was overrun with applications for work. Such is the fact as to many similar rumors and statements accepted by the public.

3. The wealth of the U. S. is so limitless, its opportunities so vast, the prosperity of certain classes so good, the wages of many artisans so high, ordinary labor, when paid at all, is so well paid, compared with European labor, that it seems incredible that at that very time others should be unable to get work at any price. Yet such is the case. Trade-union wages are high, not because there is no competition from the unemployed, but because of strict trade organization.

4. People get into the way of thinking that those out of work are so through their own fault alone because such are usually our "weaker brethren." Such forget that this *must* be so. When a man employing 100 men must discharge five, he naturally discharges the five who, for one reason or another, are the least efficient. Yet he may have discharged them, not for any especial inefficiency or fault, but because his business compelling him to discharge five, he selected them. Consolidation of business is said to have discharged some 35,000 traveling agents. Railroads sometimes lay off a thousand men at a time. When two companies combine, some clerks are

almost always discharged. Inevitably, the more efficient are retained and the unemployed are the less efficient. For many of these, especially of the clerical class, with a fair general knowledge but no especial trade, it is difficult to find work, especially if at all old. Invention and machinery also temporarily make men idle. The rapid entry of women into offices and some forms of light manufacture displaces men, at least temporarily. Other forms and often higher forms of work usually open for the abler men, but the inefficient often go months without work. The experience of certain college professors who, with plenty of physical and mental ability, have experimented in seeing if they could get work, and have found it, proves nothing. The question is, Can the inefficient get work? Yet for their inefficiency they may be by no means to blame. Born as many of them are born, bred as many of them are bred, housed as they are housed, fed as many of them are fed, it is physically impossible but that they should be inefficient. Are they, therefore, to starve?

5. It is said that they could at least be thrifty, cleanly, temperate; and that often they are not. Large numbers of the unemployed are thrifty, cleanly, temperate; but be it remembered that few apply for relief or come to the public notice until they have been unemployed for a considerable time, or only employed on very occasional jobs, so that the process of discouragement and demoralization has gone on a long ways before they attract attention. By this time many who, when they had good work, were thrifty and temperate have begun to take a weak refuge in thriftlessness and intemperance.

6. This leads us inevitably to the question of intemperance as the cause of unemployment. Some say foolishly that the question of unemployment is only another form of the drink question and that everybody could find work except for drink. Few informed students say this. Serious as is the evil done by drink, it is easily exaggerated, because if drink leads undoubtedly to evil habits, and so often at least to discharge and unemployment, it is also true that idleness and unemployment often lead to drink. It is often difficult to

know which is cause and which is effect. The facts are often, perhaps usually, so complex that most students of sociology to-day have given up asking what are the causes of drunkenness, poverty, unemployment, or crime. They are too intricate often to allow of analysis.

We come therefore, without limiting the number to those who are or who are not to blame for their unemployment, to ask how many are unemployed.

Of the number of the unemployed, in the full sense of the word, in the U. S. particularly, no man has any even approximately exact knowledge. Only a few hints can be given. Of the higher artisan class in a few cities statistics are taken somewhat exactly. Perhaps the most complete of these statistics are the returns to the New York Department of Labor and published in its Bulletin.

According to this Bulletin (March, 1907) comparatively full reports were received from the manufacturing, mechanical, and transport trades, from hotels, and some other leading occupations, and the mean of unemployment, 1902-5, was 15.1 per cent. In 1902 it was 14.8 per cent; in 1903, 17.5; in 1904, 16.9; in 1905, 11.2. But this was the mean for the whole year. In January and February it runs much higher. It is also for the better and more established industries. Fifteen per cent of the 2,000,000 members of organized labor would be 300,000.

Of the unorganized trades we have but little but guesses. Still less do we know the number of the vagrant class who have no trade. Mr. Lewis estimates them at half a million. (See VAGRANTS.)

For Great Britain, we have the following:

The mean percentage of the unemployed returned by trade-unions during 1905 was 5.4, compared with 6.5 in 1904, 5.1 in 1903, 4.4 in 1902, and 3.8 in 1901. The average percentage for ten years, 1896-1905, was 4.04.

According to the Statistical Abstract of the United Kingdom for 1906, there were in receipt of poor relief, on Jan. 1st, in England and Wales, 909,918 persons; on Jan. 15th, in Scotland, 111,202 persons; on the last day of the year and in January in Ireland, 103,302 persons; or for the United Kingdom, 1,114,522 persons, which is 2.59 per cent of the estimated population.

In France, according to the census of March, 1901, there were 314,530 unemployed, or 2.92 per cent of the workers.

Germany reported 520,728 unemployed in the second quarter of 1905, or 1.9 per cent.

But these are of the working classes. Statistics are inevitably taken mainly from the larger establishments. Of the total number who are out of work at any time in any country, we have no adequate means of knowing.

Wrote Mr. John Burns, in the *Nineteenth Century* for Dec., 1892:

Disguise it how we will, hide it tho we may, looming up is the great, the all-absorbing question for all countries and governments to face—How can the honest worker be provided with work uncontaminated with pauperism's degrading taint and charity's demoralising aid? The glib quotation of figures showing that official pauperism has decreased only insults the genuine worker who asks for work, so that it may be reduced further still. But even the official statistics, when shorn of all their complacent optimism, reveal the real nature of the problem. The fact that a cruel administration of the poor-law, which mixes honest and criminal together, has reduced official pauperism from 46 to 20 per 1,000, is cold comfort to the men who, by physical necessity or want of work, are compelled to be of the 20. The growth of trade-unionism, friendly, sick, loan cooperative,

and other agencies that the workers resort to in times of distress, is not recognized as a factor in reducing the distress which, in the absence of such agencies, the poor-law would have to meet. Exploiting the ever-increasing repugnance among the genuine poor to pauper relief, the officials representing the *laissez-faire* middle class are determined to throw the support of the worthless, that the rich and poor now sustain, on the poor exclusively, who voluntarily, taxed as they are, cannot carry further burdens.

Outside the official pauper class, as Mr. Charles Booth proves, there are hundreds of thousands of people whose standard of life and comfort, from the point of view of food, clothing, and house accommodation, is lower than that of the pauper or criminal, yet these people will not accept relief, but struggle on in the vain hope of work that never comes, and which, if it did, would find them too low to perform it. The fact is the virtue—or vice—of thrift and independence among the pick of the working classes, which well-fed reformers contend is applicable to all, is being abused and exploited. When the poor refuse poor-law relief, it is construed as proof that its abolition is justifiable. When, as a better alternative, the poor man asks for work, he is told that that is pauperism in another form. When he becomes ill through neither relief nor work being offered or accepted, or, as a last resource, thieves and goes to prison, he has to be kept, after his health and morals have been shattered, till he dies. . . . Having experienced the lot of the workless worker, I believe, with Carlyle, that "a man willing to work and unable to find work is, perhaps, the saddest sight that fortune's inequality exhibits under the sun."

III. Means Used to Meet the Problem

With the indirect means used to meet the problem we are not here concerned. Yet these may be the most important and probably are so. It is, indeed, beyond doubt that the only complete solution of the question is to prevent there being any unemployed. If education or temperance or religion or protection or free trade or socialism or individualism will so order society as to provide work for all, almost all social problems would be solved. But to this question this whole Encyclopedia is devoted and we can only consider in this article what can be done for or with the unemployed as they exist today.

This we have said must vary with the different classes of the unemployed. We can little more than name the different measures that have been tried or proposed, referring the reader to special articles for account of them.

1. Undoubtedly the first thing to do is to divide the unemployed into their different classes. Till this is done, nothing can be done with any class. Hence the work test, which has loomed so large especially in English and American attempts to grapple with the problem. It is, however, but a crude test compared with the following of the lines of individuals as in Germany. (See ELBERFELD SYSTEM; RELIEF STATIONS.) These methods enable the Germans to know what a man is and therefore to aid him wisely.

2. The second step undoubtedly is to reduce the problem to its lowest terms by obtaining employment in the quickest time for all who are employable and for whom employment can be found. This means the wisest form of employment bureau, in which Germany again seems to have worked out the best system. (See PUBLIC EMPLOYMENT BUREAUS.)

3. We come next to the question of how to deal with the somewhat employable and efficient, for whom, however, no work can immediately be found. Here America, England, and Belgium, in different ways, have been the most successful. (For the system most successfully worked out in America, see VACANT LOT CULTIVATION. For the Belgian system, see INDUSTRIAL INSURANCE. For the English system, see PUBLIC RELIEF WORKS.)

4. We come to the class more permanently unemployed, and usually for the most the unemployable and inefficient, the weak but not the confirmed and semicriminal confirmed idlers. For these the so-called labor colonies of Germany and of other countries are undoubtedly the best means. (For these, however, see LABOR COLONIES.)

5. We are left finally to consider the semicriminal and vicious and confirmed idlers, the tramp proper or vagrants. For these, undoubtedly compulsory work in colonies more or less penal, like those of Holland and Belgium, should be established. For these, different means used for different classes of the unemployed should doubtless be worked into a complete national system, as in the following plan, recommended by Percy Alden, P. M., in his book "The Unemployed."

(For New Zealand and the unemployed, see NEW ZEALAND.)

A congress as to unemployment was held at Milan in 1907, and an international committee was organized.

Schloss, *Report on Agencies and Methods for Dealing in Certain Foreign Countries*, English Board of Trade Report (1904); W. D. P. Bliss, *Report on the Employment of the Unemployed*, U. S. Bureau of Labor (1908).

UNEMPLOYMENT, USELESSNESS OF LABOR COLONIES FOR: For the genuine unemployed—the independent, self-reliant, self-respecting workers—farm colonies are an inadequate remedy, uneconomic, wasteful, and destined in the future, as in the present and past, to be a futile remedy for their workless condition.

There are several rural workhouses for able-bodied paupers; there are *al-fresco* casual wards and pastoral labor hospitals where the industrial misfits and social wreckage find refuge under coercive, restrictive, and pauperizing conditions, that the efficient but workless workmen will very properly not accept. But these institutions are but pauper auxiliaries, with the dependent, subjective, and penal taint.

They are admirably diagnosed and effectively summarized by the last Board of Trade report, which says of their foreign counterpart, of which the British are but immature imitations, "Whatever be the object of these colonies, the great bulk of the material with which they deal consists not of efficient workmen out of work, but of tramps, ex-prisoners, and others whose distress is caused by personal defects. They are not colonies of unemployed; they are receptacles for social wreckage." Writing of them recently, Mr. T. Mackay, no mean authority, says: "They are asylums more or less satisfactory to the philanthropic sentiment, more or less attractive to persons of unindustrial instincts, but in no large sense of the terms are they able to restore or to create industrial capacity in those who resort to them."

As abroad, in Germany, Switzerland, Belgium, Holland, from 50 to 90 per cent of the colonists are ex-convicts, chronic tramps, who often "go to colony after prison, or arrive in serious debility from alcoholic excess." I do not think I was far wrong when I said: "Farm colonies were only doss-houses in which good men were brought down to the level of tramps and wastrels, and became chargeable to the parish."

WHERE THE FARM COLONY FAILS

Can we wonder that these places abroad and at home are avoided by unemployed men of character, the people of whom alone I am speaking? Their reasons for so doing are commendable in every way. The isolation of a farm colony from industrial centers, its distance from the normal labor market, prevent the genuine unemployed workman, anxious to take up his work, from resuming his proper and profitable place in the ranks of labor when his opportunity for employment arrives.

The farm colony breaks up family life by withdrawing the father and breadwinner from his family, and even where this may sometimes lead to his physical benefit, it often results in greater moral detriment to himself and family.

CANADIAN EXPERIENCE

It is all-important, at this moment, when the unemployed are being exploited by advertising and rival religious leaders, when real and permanent remedies for the prevention of the unemployed are being pushed aside by social freaks, economic charlatans, and settlement quacks, each with his patent pill, that some one should enter a protest against costly and illusory projects and delusive remedies for the unemployed. I feel justified in taking this view, as in a recent tour in Canada I traveled several thousand miles to see some ten colonies in which this problem was being dealt with; the only satisfactory examples were the Doukhobor settlements, that are not labor colonies at all.

The time has arrived, now that London, through Mansion House funds and other undesirable means, is attracting the provincial workless wastrels, and the tramp, to the metropolis, to the detriment of its own decent unemployed, that some direct speaking should be given in protest against this kind of thing.

The worst way to help the unemployed, in my judgment, is to put them in small celibate compounds on pauper patches in rural districts. The better plan is to prevent them, as free men, being driven from the land in droves. An Essex laborer dispossessed from the soil, briefly employed at the East End, then sent to a farm colony, is worse for the transposition. He has been "institutionalized," and I never yet knew the average man survive that pauperizing ordeal.

JOHN BURNS, M. P.

UNION LABEL, THE: A trade-mark owned and registered by a trade-union. It is usually granted by the unions to those firms which employ union labor only, and is to be attached to articles of sale to indicate that they have been made under conditions stipulated and approved by the organization.

The purpose of the union label is to gain friends for organized labor among the general public and to confine the patronage of union men to the goods of employers who pay union wages, and otherwise conform to the conditions stipulated, e. g., in regard to hours, sanitation, and places of manufacture. From this point of view the label is a legal or negative boycott, since the employers to whom it is granted are on the "fair list."

The history of the union label dates from 1874, when it was first used by cigarmakers in California as a protection against Chinese labor. Its origin is closely connected with

the race question, since it arose as a result of the more intense competition due to a larger immigration of skilled workmen, beginning with 1870. Owing to this fact the label has not been widely adopted in Australia, since the trade-unions in that country have always been successful in keeping out cheap labor. The Trade-Union and Cooperative Congress in England approved it in 1893, and it was adopted by the hatters. But in Canada and the United States the label has been widely used as a weapon to "maintain the white as against the coolie standard of life." During a strike in St. Louis (1875) a discussion arose as to the color of the label; this was settled at the convention in Chicago (Sept., 1880) by the adoption of blue.

The extent of the use of the label is enormous. The hatters' unions adopted it in 1885, and reported 3,120,000 labels used in fourteen towns from Dec. 1, 1896, to June 1, 1897, and about 12,000,000 for the U. S. in 1897. It is estimated that over 100,000,000 were used by different unions from 1885 to 1900. Various unions have urged all the "locals" to adopt the label all over the country. The American Federation of Labor recognized and approved forty-three labels in 1903, but advocated the use of its own label.

The benefits of the label have been numerous for organized labor, owing largely to systematic and persistent advertising. The cigarmakers seem to be in the lead in this respect, e. g., Cigarmakers' Union No. 97 expended over \$3,188 in 1896 for "label agitation"; other unions spent smaller amounts.

Finally, state legislatures have granted legal protection to the label. Illinois, for instance, makes its counterfeiting or unauthorized use a semicriminal offense, and penalizes it with \$100 fine or imprisonment. In 1898 the label was protected in twenty-eight states, and in 1900 in thirty-two.

Since that time the label has increased as a commercial asset for the trade-unions, since many employers find its use a good advertisement, and are perfectly willing to conform to the conditions stipulated.

RUDOLF M. BINDER.

UNION LABOR PARTY: This was a political party organized at Cincinnati, Feb. 23, 1887, mainly by representatives of farmers' organizations of the West and Western Middle States, with many of the old Greenback Party (*q. v.*). Its platform declared for a graduated land and income tax; government telegraphs and railroads; abolition of national banks; free coinage of silver; payment of national debt at maturity; exclusion of the Chinese; woman suffrage; arbitration of labor disputes; and against contract labor in prisons, the further issue of interest-bearing government bonds, and the employment of armed men by private corporations. It polled an insignificant vote, but led to the formation of the People's Party (*q. v.*).

UNIONIST PARTY: The name commonly used in Great Britain to-day for the party formerly called the Conservative Party, as indicating the union of all those who believe in the maintenance and defense of the existing Constitution and political institutions of the British Empire, tho with such constructive and progressive legislation as shall adapt these to the growing needs of the people without, however, any fundamental change, either in the empire or the United Kingdom, in State, Church, or social organization. Its keynote may be said to be at present the exaltation of the empire, calling for preferential tariff arrangements with the colonies and protection or at least tariff discrimination against other powers, the maintenance of the House of Lords, and in general the rights of property and private initiative, as against all beginnings of republicanism and socialism, the maintenance of a strong army and

navy, paternal legislation for the benefit of the industrial and working classes, education, with much recognition of the Church of England as the State Church.

For the position of the Unionist Party on the two important topics of the tariff and of education, see special articles **TARIFF REFORM IN GREAT BRITAIN**, from the standpoint of Mr. Chamberlain, undoubtedly the leader of the Unionist Party upon this line, and **SCHOOL QUESTION IN GREAT BRITAIN**, Section I, from the standpoint of the Church of England.

On other questions the following quotations may be said to be semiauthoritative, being from campaign pamphlets published by the National Union of Conservative and Constitutional Associations, the central propaganda body of the Unionist Party.

On the mooted question of the House of Lords these pamphlets say:

Why abolish the House of Lords because it can suspend too hasty or ill-considered legislation on the part of the House of Commons?

Why not abolish the House of Commons because it often vetoes the legislation of the House of Lords?

The House of Lords has the older standing, the greater intellect, and, above all, the freedom to consider questions on their own merits alone, which the House of Commons, subject as it is to electoral caprice, can never have.

It is often asserted that the existence of the House of Lords is opposed to the principles of democracy, but few of those who make this assertion have ever considered what it means.

The principle of a democracy is that the deliberate wish of the nation as a whole ought to prevail in all questions of government. This is easily provided for in all cases where a large majority of the nation is of one opinion; it is difficult, if not impossible, to attain when the nation is equally divided upon any question. It often happens that the supporters of a particular view, though a minority of the electors, are able to

secure the return of a majority of members holding their opinions. If it is not a party question, candidates on both sides are selected from men holding the opinions of these electors, who, though comparatively few, may be numerous enough to turn the election in the particular constituency.

Again, at most elections there are more questions than one prominently before the electors, and some of the electors support the candidate of their choice on one ground and some on another, so that the member when elected cannot say that upon either question he certainly represents the views of the majority of the electors.

In the interests of democracy itself, therefore, it is necessary that there should be some authority to prevent laws being passed by the House of Commons against the wishes of the people, and this can best be done by a second chamber. In America the elected Senate is stronger than the House of Representatives, which is fatal to the democratic principle. In France the two chambers, if they differ, sit together, and the majority of the House of Representatives, if small, does not always prevail even where it represents truly the views of the nation.

The English House of Lords appears of recent years to have performed the duty required in the interests of democracy more successfully than the senates of foreign countries. Being an hereditary House it can without discredit yield to the will of the people if clearly and deliberately exprest, and yet being independent it can resist the House of Commons when it is really doubtful whether their decision expresses the deliberate wish of the nation.

During the Parliament of 1892-94 the Lords more than once stayed the hand of the House of Commons. In the case of Home Rule, the nation had in 1886 pronounced strongly against it, and in 1892, by a small majority, if any, in its favor. It was impossible, therefore, to say that the deliberate opinion of the nation had been exprest, even on the general question. On the particular bill it certainly had not been exprest, and few people now believe that the Home Rule Bill was really desired by a majority of the electors. The clause of the Employers' Liability Bill prohibiting contracting-out was an endeavor to impose a serious restriction upon the liberty of the working classes and was carried by so small a majority in the House of Commons, notwithstanding all the exigencies of party, as to leave it quite uncertain what were the real views of the majority even of the elected representatives of the people. In 1906, in the case of the Plural Voting Bill, the House of Lords simply upheld the old constitutional principle, that any alteration in the franchise must be accompanied by a redistribution of seats, while with regard to the Education Bill, as every sec-

tion of the community which was concerned or interested in its provisions had most vigorously protested against one or other clause of the measure, it is perfectly obvious that in amending it the Lords did not oppose the wishes of the people.

In each case the action of the House of Lords was such as to secure, and not to thwart, a deliberate expression by the nation of its desires.

When those desires are exprest at a general election the House of Lords conforms to them.

In opposition to socialism, the Unionist pamphlets say:

Socialism means the end of liberty—the Socialists would make every man a puppet and a slave to the Socialist god—the State. All men would become machines for the use of the State, their work parcelled out when, how, and where the State thought fit, and its results snatched from them for the purposes of the State.

Socialism would seize from every man his home and belongings. Under socialism no man must own anything; everything would belong to the State. All the savings of years of thrift would be taken and thrown into the common pool.

Opposition to Socialism Socialism would destroy family life and take away those sweet things that make the English idea of home the best thing in the world.

For "home," socialism would substitute gigantic barracks where you would be compelled to live and have your meals divided out to you, of such kind and quantity as the State decided, in such company as the State chose for you. If you wanted more tea, more beer, more tobacco, however honestly you had earned it, you could not have it. You must have no more than your neighbors. Socialism would kill all enterprise and stop progress, individual and national. Under socialism no man could rise. Can you conceive what life would be without ambition or hope? Without the possibility of reaching to better things? Without the chance of carving out for yourself a higher future? With the deadening knowledge that as you are so you shall remain, with your life State-planned, State-run, State-crushed? Is not this black despair? Under our present conditions, however low down a man may start, he has it in his power to make his future. Consider the thousands of men who have risen from nothing to eminence.

There is no need for socialism. Not because the present state of things is perfect. But every year sees the worker's lot improved. The aim of every piece of labor legislation is to bring into being benefits which could not be possible under socialism. And with it all the marked liberty is not lessened; it is increased. Why, then, give up liberty for nothing?

In opposition to the Liberal (or Radical) Party, the Unionist Party claims that:

(a) That party has not fulfilled its pledges on the old-age pensions, an unemployed act, reduction of the income tax, a licensing act, retrenchment.

(b) It has thrown many men and women out of employment, by reducing the work at the arsenals, and by buying supplies for the army outside of England.

Opposition to Liberalism (c) It has aroused serious hostility toward the mother country among the colonies: in South Africa, by its anti-British policy; in Natal, by blundering interference in local affairs, causing such resentment as to make the Natal Ministry resign; in New Zealand, by a gross betrayal of the colonists' interests—the making of a treaty contrary to their wishes; in Australia and New Zealand, by riding roughshod over colonial sentiment in the matter of the New Hebrides convention.

(d) In regard to Chinese labor in South Africa at the very time when the Radicals were circulating lying slanders about the Chinese labor ordinance, they were actually themselves making a similar ordinance (but harsher) to bind the blacks of the New Hebrides.

But the position of the Unionist Party is by no means purely negative and defensive. It claims, on the contrary, to be the party of achievement and construction. It claims among other things to have introduced:

(a) Most of the progressive industrial legislation of England in which England, until recently, at least, has led the world.

(b) The Agricultural Rating Act, 1896, and Continuation Acts of 1901 and 1905. This act lowers the local rates payable by agricultural land in England and Wales by one half. It provides £1,333,000 a year out of the Imperial Exchequer to relieve land from its heavy and unjust taxation, local taxation being the heaviest burden upon land. It affects all classes interested in the land, and especially the farmer and laborer.

(c) Agricultural Holdings Act, 1900. (This act is of great

importance to the tenant farmers, giving them increased security in the value of their improvements.

(d) The Workmen's Compensation Act, 1897, Extension Act. This act, passed in 1900, confers upon agricultural laborers the benefits of the Workmen's Compensation Act of 1897.

(e) Other acts like the Light Railways Act, 1896, the sale of food and drugs acts, etc.

(f) The Unionist claims that "the long period of Conservative predominance has synchronized with and generously aided the growth of the imperial idea," preserving the empire intact, developing progress in India, Canada, Australia, Egypt, etc.

(See **TARIFF REFORM IN GREAT BRITAIN.**)

UNITED KINGDOM ALLIANCE, THE: The United Kingdom Alliance is an association of temperance and social reformers, formed in Manchester, England, 1853.

DECLARATION OF PRINCIPLES

1. That it is neither right nor politic for the State to afford legal protection and sanction to any traffic or system that tends to increase crime, to waste the national resources, to corrupt the social habits, and to destroy the health and lives of the people.

2. That the traffic in intoxicating liquors, as common beverages, is inimical to the true interests of individuals, and destructive to the order and welfare of society, and ought, therefore, to be prohibited.

3. That the history and results of all past legislation in regard to the liquor traffic abundantly prove that it is impossible satisfactorily to limit or regulate a system so essentially mischievous in its tendencies.

4. That no considerations of private gain or public revenue can justify the upholding of a system so utterly wrong in principle, suicidal in policy, and disastrous in results, as the traffic in intoxicating liquors.

5. That the legislative prohibition of the liquor traffic is perfectly compatible with national liberty, and with all the claims of justice and legitimate commerce.

6. That the legislative suppression of the liquor traffic would be highly conducive to the development of a progressive civilization.

7. That, rising above class, sectarian, or party considerations, all good citizens should combine to procure an enactment prohibiting the sale of intoxicating beverages, as affording most efficient aid in removing the appalling evil of intemperance.

The alliance has no test of membership bearing upon the personal habits of its members, or as to their religious creed or political party. It invites the aid and cooperation of all good citizens, whether abstainers or not. It has but one object—the removal of the liquor traffic by a law, enacted by Parliament and enforced by public opinion, working through the executive power of the State. *Secretary, Mr. W. Williams, 16 Deansgate, Manchester, England.*

UNITED LABOR PARTY: This party was organized in 1886 in New York, and based upon the single-tax principle. Henry George, one of its chief promoters, was nominated by it for Mayor of New York in the same year. He received over 68,000 votes, as against over 90,000 received by the Democratic and over 60,000 by the Republican nominee. The following year a convention was held at Syracuse, the organization of the party was perfected, and measures taken to spread it through the state. Henry George was nominated for Secretary of State of New York. In the election he received 70,055 votes, against 469,888 for the Democratic, 452,811 for the Republican, and 7,622 for the Progressive Labor candidate. The United Labor Party declared in its platform that it does not seek to "secure any forced equality in the distribution of wealth, nor propose that the State shall take possession of land, and either work it or rent it out," but that its aim is to abolish all restrictive taxes upon industry, to remove the tax from improvements, and increase the land tax. Its platform advo-

cated government ownership of telegraphs and railroads; prohibition of child labor and competitive convict labor; reduction of the hours of labor; prevention of the abuse of the conspiracy laws; legal and judicial reform; and a mode of election that would check bribery and corruption by relieving the candidates of expense. After this election its chief promoters mainly united with the Democratic Party in the hope that that party would lead in battle for free trade, and thus, by abolishing protective taxes, pave the way for the single tax (q. v.).

UNITED MINE WORKERS OF AMERICA, THE: Organized in 1890, it has a total membership in the United States exceeding 300,000. Its officials claim for it the distinction of being the strongest and largest single trade-union in the world. It is well organized in at least ten of the twenty-seven coal-producing states, and is gradually extending its power into all of the twenty-seven. About 75 per cent of all the coal-mine employees in the country are at present members of the union; more than 85 per cent of the total of 486,000 are governed by the union's scales and work under its conditions of employment, and, the officials of the union claim, fully 90 per cent of all coal-mine workers in the U. S. would go out on a strike if a national suspension of coal-mining is ever found to be necessary by the union.

The United Mine Workers of America is one of the most democratic organizations in the world, with the possibility of it all at once becoming one of the most autocratic. It is democratic in the sense that in the final analysis its policy and management are in the hands of its members. To them, in their local unions, every great question affecting the national union is referred sooner or later; from the local unions come the final decisions on all such questions.

Once a year representatives of the local unions meet in regular convention as the national union, usually at Indianapolis, and for ten days or two weeks outline the policy of the national union for the ensuing year. This convention possesses absolute power; there is nothing affecting the organization it cannot do, even to altering or amending its fundamental law—the constitution. It can even abrogate, if it so chooses, the agreement of the Interstate Joint Conference.

No strike can be ordered by any district, nor can final action be taken upon any questions directly or indirectly affecting the interests of the mine workers of another district, until the approval of the national president is secured in writing, or, he having disapproved, until favorable action upon an appeal from his decision has been taken by the Executive Board. An exception to this, of course, is in case the strike or action has been ordered by the national convention.

The vesting of such great power, by the United Mine Workers of America, in the hands of one man is due primarily to the exigencies of strike times when, for all practical purposes, the union becomes a military organization, in the control of which there must not be the least possibility of divided leadership.

Under the constitution every local union is required to pay into the national treasury a per-capita tax of ten cents a month for each member and such additional assessments as may be levied

by the National Executive Board. Boys under sixteen years of age are regarded as half members and pay one half as much tax and assessments as full members. These dues and assessments from the locals form the principal sources of income for the national union. When a strike of unusual proportions is in progress contributions from other labor organizations and from the general public increase the funds in the national treasury. The important part these play in the conduct of the organization was shown during the six months' strike in the anthracite region of Pennsylvania in 1902. To carry on that struggle alone, not including the expenses accompanying the strike of mine workers in progress at the same time in the Virginias, the various unions of the United Mine Workers of America voluntarily donated \$258,344, and the members of the organization paid in special assessments \$1,967,026, a total of \$2,225,370.

So well organized are the finances of the United Mine Workers of America that the national union was able to carry on a wide-spread system of relief to the needy anthracite mine workers during the last two months of the strike in 1902. In this relief work no distinction was made between union and non-union men. In fact the testimony of many witnesses is to the effect that aid was furnished as freely to the non-union as to the union mine workers.

Since 1885 the union has held an annual joint conference with representatives of the operators and coal-mining companies of Ohio, Indiana, Illinois, and the Pittsburg field of Pennsylvania. In these conferences labor is regarded as a commodity, and the possessor of this labor—the mine worker—is accorded the right, through representatives of the union, to "bargain" with representatives of the purchasers of that labor—the coal-mining companies—for the price of his labor and the conditions under which it is to be sold.

Since the great strike of 1897 the United Mine Workers has extended the eight-hour work-day into the mines of Iowa, Missouri, Kansas, Michigan, Kentucky, and parts of Tennessee, and has secured for the mine employees of those states increases in wages ranging from 13 to over 30 per cent. Increases in the wages of mine workers in other states have also been secured through joint conventions with the operators, and increases in wages, with improved conditions of employment, were forced from the railroad mining companies and independent operators in the three hard-coal fields of Pennsylvania in 1900 and 1902. (See ALSO COAL STRIKE AND WESTERN FEDERATION OF MINERS.)

FRANK J. WARNE, PH.D.

UNITED STATES, THE. (For all statistics and details, see special articles. In this article we very briefly outline the story of social reform in the U. S. so as to bring out the continuity and the connection of the various movements.)

Social reform in the U. S. may be said to have commenced with the political agitation over the adoption of the Constitution. As is well known, it was with the utmost difficulty that the various states were induced to ratify the Constitution. It was held by large masses of the people in all the various states that the Constitution was a concession to aristocracy and the power of wealth in giving too much power to the central government and thus subverting the very principles of democracy upon which the American government was supposed to rest. While, therefore, the leadership of Washington, Hamilton, and others

brought political success for a while to the Federalists, the supporters of the Constitution, a strong party of decentralization was growing up, led by Thomas Jefferson, which finally won political success in the presidential elections in 1801, with Jefferson as president. "The Republican and Democratic Party," as the party supporting this view was then called, remained in power under the presidency of Jefferson, Madison, and Monroe until 1825, and was strong with the masses of the country and the agricultural interests, the opposing Federalists being mainly strong with the commercial and manufacturing interests of the North. The doctrine of decentralization was during this period largely applied not only in the central government but in the states, it being generally held even by both parties that that was the best government which governed least. It was during this long period too that the U. S. developed its national tendency to individualism and the minimizing of government action, federal, state, and local. (For all this, however, see article CENTRALIZATION.)

The first steps to reform other than political were, as is well known, in the agitation against slavery. The Pennsylvania society for the abolition of slavery was formed as early as 1774, and abolition societies followed in almost all the states in the immediately ensuing years, including Virginia (1791). The abolition of the slave-trade by Great Britain (1807) was followed by that of the U. S. in 1808. Nevertheless the issue between the slave power and the abolitionists increased steadily in popular interest. In 1831 Garrison (*q. v.*) established the *Liberator* in Boston, and in 1832 the New England Anti-Slavery Society was formed. (For all details, however, see article ABOLITION.) The Liberty Party was formed in 1840, the Free Soil Party in 1848, leading to the formation of the Republican Party and the War of the Rebellion, till in 1870 the American Anti-Slavery Society disbanded, believing its work fully done.

Distinctive economic and labor reform in the U. S. came much later, altho a few trade-unions were formed very early in the nineteenth century if not in the eighteenth. (See TRADE-UNIONS IN THE UNITED STATES.) The really formative period of American trade-unionism, however, did not begin till 1825, and then only gradually became active until 1840, when it was somewhat submerged by the interest in Fourierism. Various labor papers were published during this period and important labor organizations attempted. A Workingman's Convention was held in Syracuse as early as 1830 and made a labor nomination for the governorship of New York.

The Labor movement, however, early became largely identified with the eight-hour movement, and from 1840 to 1850 this was the important subject of agitation in labor circles. In 1840 President Van Buren issued a proclamation establishing the ten-hour system in the U. S. Government establishments. (See EIGHT-HOUR DAY.)

Meanwhile, although having little direct connection with the general economic movement, industrial colonies of one kind or another were established in the U. S., mainly from Europe. The Shakers, led by Ann Lee, first came to the U. S. from England in 1774 and were gathered into Settlements in 1787. The Harmonists (*q. v.*) came to America in 1803. In 1825 Robert Owen established his short-lived community in New

**Early Labor
Movement**

Harmony, Ind. (For these and other colonies, see COMMUNITIES.) These colonies, however, led to a considerable development of the community idea in the U. S. itself, the most important result of which was the foundation of Brook Farm in 1842. This, however, was swallowed up in the wave of Fourierite socialism which swept over the U. S. from 1840 to 1850. In 1840 Brisbane (*q. v.*) published his "Social Destiny of Man," and in 1843 Horace Greeley opened the columns of the New York *Tribune* to the teachings of Fourierism. Fourierite phalanxes were established almost by the dozen. Even Brook Farm became a Fourierite phalanx in 1844. The movement, however, did not endure, and by 1850 it was practically at an end.

After 1850 the political events which preceded the war absorbed attention, altho various labor-unions were formed and considerable agitation created in various social and economic lines. All this, however, was for the time forgotten in the Civil War.

At the close of the war a new era of social reform begins in the U. S. The first political movements were connected with the greenback and currency question (see CURRENCY), but the trade-union movement was not inert. A National Labor-Union had been formed in 1860, but had not endured, and in 1866 another National Labor-Union was formed. A grand Eight-Hour League was organized, and later (1869) the smaller but more influential Boston Eight-Hour League. The efforts of this league led to the establishment of the Massachusetts Bureau of Labor in 1862, the first labor bureau of the world. In 1874 Massachusetts enacted a ten-hour law for women and children under the age of eighteen. Since then the progress of labor legislation has been almost steady. In 1870 and 1871 we have the first beginnings of the direct connection between the labor movement in the U. S. and in Europe, when a few branches of the International (*q. v.*) were formed in the U. S., but did not take deep root. In 1873, however, an attempt was made to reorganize the National Labor-Union and an important congress was held in Rochester and drafted a platform which later became almost without change the famous platform of Knights of Labor (*q. v.*). This great order was first established as a secret labor-union in 1869, though it did not hold its first general assembly until Jan. 1, 1878. Meanwhile various trade-unions had been growing in power and believing in the principles of trade autonomy and federation instead of a merging in one general organization like the Knights of Labor. Various attempts at such organization were made, resulting finally in the formation of the American Federation of Labor in 1886. (See AMERICAN FEDERATION OF LABOR.)

Socialism, as a political movement, began in the U. S. much later than in Europe. After the collapse of the revolutions of 1848, however, a few European exiles, mainly German, sowed the seeds of international socialism in the U. S., and a few local Socialist societies were started principally in or near New York City. They, however, were for the most part forgotten in the war and the new problems that sprung up at its close. In 1876, however, a Social Democratic Workingman's Party cast 1,365 votes in the City of New York. In 1877 it changed its name to the Socialist Labor Party. It was, however, composed largely of Germans and was little in touch with the native Amer-

ican trade-union movement. It was, too, like the early European international movement, by no means free from the anarchist movement, and did not become so till the two wings of the party completely split in 1885. After that the Socialist Labor Party grew, till the policy it developed of hostility to the trade-union movement (since the movement as a whole would not declare for political socialism) dissatisfied a large number of the members of the party, particularly in the West, and the Socialist Democratic Party was organized in 1898. Since then the Socialist Labor Party has grown steadily relatively smaller, and is now confined mainly to the followers of Mr. Daniel De Leon (*q. v.*) in New York City and elsewhere. The Socialist Democratic Party (now called in most states the Socialist Party) has become the main representative of political socialism in the U. S. Its platform and policy are those of international socialism, while as concerns trade-unionism, it strives to induce trade-unions to declare for political socialism. In this for the most part it fails, tho a few unions, notably the Western Federation of Miners (*q. v.*), have done so. Nevertheless, its members work more or less in harmony with the unions on trade-union lines and the party vote steadily grows. (See SOCIAL DEMOCRATIC PARTY.)

A distinctively American Socialist movement, however, began in 1888 when a Nationalist Club was founded in Boston to advocate the ideals portrayed in Edward Bellamy's "Looking Backward" (see NATIONALISM), and led to a very general discussion and propaganda

Nationalism

of Socialist ideas throughout the country. Various similar clubs were formed, with one or two attempts at political organization, particularly in California. The movement, however, did not endure in organized form, but for the first time the seeds of political socialism were widely sown in the U. S. Almost at the same time and with the same result of unending organization, but with the sowing of germinal seeds far and wide, we have a Christian Socialist movement beginning also in Boston in the Society of Christian Socialists organized in 1889. This was a definitely Socialist body and movement, tho there have also been various Christian Social societies in the U. S. not definitely socialistic, such as the Christian Social Union, the Church Association for the Advancement of the Interests of Labor, the Brotherhood of the Kingdom. (See their respective names.) In 1906, however, a new Christian Socialist Fellowship (*q. v.*) was formed in the West on definite Socialist lines. (See also CHRISTIAN SOCIALISM; BLISS; HERRON; CARR.) The seeds of this Nationalism and Christian Socialism, however, early passed into the Populist movement and largely influenced it.

The Populist Party. This party, the outgrowth of the Farmers' Alliance (*q. v.*) which began in Texas as early as 1876, was formed on a national basis at Omaha in 1902, tho a Kansas People's Party was formed in 1890 and had large success in that state.

Into this party came many elements, however. A National Greenback Party had been formed in 1876, on the greenback issue (see GREENBACK PARTY), but later united with "labor reformers," and as the national "Greenback Labor Party" in 1878 polled over 1,000,000 votes and elected fourteen representatives to Congress. In 1880, however, it polled only 300,867 votes and in 1884 only 175,380 on an "antimonopoly" platform. In 1887, however, a National Union Labor Party was organized at Cincinnati, which, tho polling a small vote in 1888, kept this movement alive in 1890. All these elements—

Socialism

People's Party

greenback, labor, and nationalists—united with the Farmers' Alliance in the People's Party. Tho called a labor party, it had, however, little or no connection with the trade-unions or their members and was rather a farmers' and middle-class movement. As a result it stood for greenback and silver currency ideas (see CURRENCY), together with socialistic ideas, such as the nationalization of railways, etc. When, therefore, these ideas, largely through the influence of Mr. William J. Bryan, captured the Chicago Democratic Convention in 1896, the People's Party by a large majority voted to fuse with the Democratic Party, and thus became lost in it, in spite of the efforts of a small minority to keep the party alive.

The result has been to divide the Democratic Party into a minority (nationally not small and possessing influence and wealth) of old-time Democrats unfavorable to most progressive measures and intensely individualistic; and a majority favorable to socialistic measures but with no concerted platform or policy on which it is agreed, since it largely represents an attempt to unite socialistic measures to an individualistic basis. Prominent leaders like William J. Bryan, Tom Johnson, the able single-tax mayor of Cleveland, W. R. Hearst, and others succeed in doing this to the satisfaction of themselves and their followers, but without national union.

Meanwhile the Republican Party, born of the antislavery movement (see ABOLITION MOVEMENT), and heir to the federal traditions and the economics of protection, has been the party of construction and of support of the federal government, as against state rights.

Nevertheless, becoming the party of protection and of gold, it has become a party whose machinery and politics are controlled by capitalists and monopolists, and therefore the party of the rich, plus a large middle-class vote of respectability and conservatism, together with the negro vote and a large vote in cities dominated by Republican bosses. Against this party machinery Mr. Roosevelt has struggled with so-called antitrust measures (see RAILROADS, etc.) with the result that the Republican Party has become divided with the president, popular with the people, and the monopolists in control of the party machine. Thus neither the Democratic nor the Republican Party comes before the country with a united front, but the Republican Party with the immense advantage of being in power, having access to large moneyed support, and of being the party to which the country owes its "success." Meanwhile the Prohibition Party, formed in 1869 as a national party, from 1892 to 1896 added to its platform various other reforms, which it has since largely abandoned for prohibition simply.

Such, very briefly stated, have been the main national political reform movements. The main political movements, not national, have been various efforts at municipal reform; at first mere sporadic uprisings of outraged citizens in temporary non-partisan political movements to oust an unusually corrupt administration, or more frequently the unusually open corruption of a ring (see TAMMANY HALL; CORRUPTION), but developing later permanent organizations, and

later still the Law and Order Leagues which sprang up during the eighties, and more thorough organizations like the Municipal Voters' League of Chicago, organized in 1896, and the Municipal Leagues of Boston, Philadelphia, Baltimore, and others, and finally uniting these in a National Municipal League with affiliated societies in every large American city and an intelligent civic reform movement now sweeping through the land.

In state action there have been various efforts at reform, as in Pennsylvania, Missouri, and Wisconsin, and still more frequent efforts at anti-monopoly legislation, as in the Granger laws enacted in many central western states, laws requiring three-cent-a-mile rates and other "reforms" enacted in many states in 1906, and "so-called" anticombination laws enacted at different times in almost every state and almost universally without result. Some states have enacted some tax-reform legislation. In 1886 Mr. Henry George, nominated for the mayoralty by the United Labor Party, conducted a phenomenal campaign for the single tax in New York City, polling 62,110 ballots, followed in 1886 by a state campaign. The results of these campaigns and brilliant lectures delivered by Mr. George throughout the U. S., and after his death by many able champions, has been to develop no party, but to affect some tax legislation and enroll many devoted adherents mainly in the radical wing of the Democratic Party. Anarchism (*q. v.*) has had some brilliant advocates in the U. S., but has affected no national movement. The significant and epoch-making hanging of the so-called "Chicago Anarchists" (*q. v.*) in 1887 is the only important anarchist event.

Temperance in the U. S., on the contrary, has had much political activity in the U. S. nationally through the Prohibition Party (see above), but far more effectively through LOCAL OPTION (*q. v.*) which has carried the discussion of temperance into almost every town and village in the U. S.

Most effective in this line has been the work of the women, and particularly of the National Woman's Christian Temperance Union, beginning in the Woman's Crusade of 1874 and organized by Miss Frances E. Willard into a world's Christian Temperance Union in 1883. More recently considerable temperance agitation and also with bearing on legislatures has resulted from the Anti-Saloon Leagues, begun as a state movement in Ohio in 1893. In these educational and moral movements has the main work for temperance been done in the U. S. rather than in the adoption of prohibition by certain states, as in "the Maine Law" of 1851, the adoption of prohibition in Kansas in 1890, or the adoption of the dispensary system by South Carolina in 1893. (See, however, TEMPERANCE and the various temperance movements and ideas under their different names.)

Cooperation and, to a much less extent, profit-sharing have had repeated and widely scattered trials in the U. S., but without developing a concerted national movement, as in other countries, unless it be the BUILDING AND LOAN ASSOCIATIONS of the U. S., which lead the world in that especial form of cooperation. (See COOPERATION; PROFIT-SHARING; BUILDING AND LOAN ASSOCIATIONS.)

Communities of almost every kind have also been tried in the U. S. After the failure of the Fourierite communities there were no large attempts in this line till about 1885, when for about fifteen years we have a long line of experiments, almost all, however, disconnected and almost all disastrous and short-lived. (But see SHAKERS; AMANA FAIRVIEW AND HOME COLONY; and also COMMUNITIES.) Less ambitious but more practical efforts, however, mainly on the parts of employers, have developed many so-called "model villages" and have resulted in many activities

Present Parties

Other Movements

Municipal Reform

for the benefits of the employed. (See **MODEL VILLAGES**; **INDUSTRIAL BETTERMENTS**.) "Settlements" have been founded in

Non-Political Reform very large numbers in all of the large and not a few of the smaller cities, particularly since 1895, and some of them with very great success, like

Hull House in Chicago, founded in 1889, and which may be said to have affected the whole city if not the country. (See **SETTLEMENTS**.) Many churches have undertaken social activities. (See **INSTITUTIONAL CHURCHES**.) Charities and philanthropies of almost every kind have had a very large development. (See **CHARITY ORGANIZATION SOCIETIES**; **BATHS**; **LIBRARIES**; **KINDERGARTENS**; **RECREATION CENTERS**; **REFORMATORIES**, etc.)

Civil service reform has been largely and successfully adopted. (See **CIVIL SERVICE**.) Primary reform has been much less developed, but is successfully beginning. (See **BALLOT REFORM**; **PRIMARIES**.)

The **REFERENDUM** and the **INITIATIVE** have been largely discussed and quite recently adopted in several western cities. (See **DIRECT LEGISLATION**.)

Labor Bureaus and **LABOR LEGISLATION** have had considerable development (see those subjects), undoubtedly largely due to influence of the great growth of organized labor (see **TRADE-UNIONS**), perhaps in their turn largely occasioned by the phenomenal growth of combination in capital. These great aggregations of capital on the one hand and labor on the other have led to gigantic strikes which have assumed national importance, notably the Pittsburg railroad and coal strikes of 1879, the strikes on the Gould railroads in the early nineties, the great Pullman strike of 1894, and the Homestead strike of 1892, and perhaps greatest of all the coal strike of 1902. All of these great struggles, and of numerous smaller, whichever side has immediately won, both sides in the long run have seemed to emerge more strongly organized and yet with increased respect for their opponents' strength. The result has been wide discussion and considerable adoption of methods of arbitration and conciliation, tho compulsory arbitration has received little favor. In this movement the National Civic Federation, organized nationally in 1901, has been a leader. (See **ARBITRATION**; **CONCILIATION**; **OPEN AND CLOSED SHOP**, etc., etc.) Perhaps especially characteristic of the U. S., however, has been the large development of women's clubs of various kinds, and especially the entry of women into almost every kind of professional and industrial life. Only four states, Wyoming (1869), Colorado (1893), Utah (1895), and Idaho (1896), have granted complete woman's suffrage and that with little effect, of either the good results claimed by its advocates or the evil results feared by its critics, but many states have granted school suffrage with, in a few instances, municipal suffrage, and probably in no country is woman's educational and social influence so potent and actively used as in the U. S. Women have entered very largely into industrial life. (See **WOMAN'S MOVEMENTS**; **WOMAN'S SUFFRAGE**; **WOMEN'S TRADE-UNIONS**; **WOMEN'S FEDERATION OF CLUBS**, etc. See also special articles on all important subjects.)

UNIVERSITY EXTENSION: The University Extension movement dates from the pressure brought to bear upon the universities of England

to extend their benefits to men and women who could not attend their regular sessions. Beginning in 1867, Prof. James Stuart and others began lecturing to bodies of club women, teachers, and workmen, especially in the northern industrial districts of England. The University of Cambridge appointed a committee in 1872, which reported in 1873, recommending the university experiment with courses of lectures in two or three towns. In the winter of 1873 the

Origin first lectures authorized by the university were given in Leicester, Derby, and Nottingham. These lectures followed the methods which have become the distinguishing characteristics of university extension, the lecture being followed or preceded by the quiz, the weekly or fortnightly paper presented by volunteer students, examination, and the printed syllabus.

In the absence of a teaching university in London a society was established in 1876 to extend the methods of the university. In 1878 the University of Oxford followed this example with little success, until in 1885 it began to offer courses of six lectures instead of the twelve which had remained the unit with the other organizations. The rapid growth of university extension in the next few years inspired imitators in America.

Experimental lectures were given in 1887 and succeeding years, and in 1890 the Philadelphia Society for the Extension of University Teaching was organized. The following year the American Society for the Extension of University Teaching grew out of this local effort. The first president of the American society was Prof. Edmund J. James, subsequently director of the Extension Division of the University of Chicago.

The movement took root in the West in the organization of the Chicago Society for University Extension, in 1891. This organization undertook to correlate the efforts of half a dozen of the universities in the middle West, and was responsible for much of the pioneer work in that section. During those earlier years spasmodic attempts were made by other universities, notably by the Universities of Iowa, Wisconsin, Cornell, and Brown, but the first institution to incorporate university extension methods as an integral part of its organization was the University of Chicago, which on its foundation in 1892 accepted the extra-mural teaching as one of its functions. The prophetic instinct of Prof. William Rainey Harper saw a field for the university which was nothing less than world-wide, and planned to send members of the faculty out through the country, for lectures throughout the city and suburbs, for the conduct of classes, duplicating university work and their teachings by correspondence throughout the world. These three methods are still followed by the University of Chicago with increasing success.

Recently the University of California has organized an Extension Department under the direction of Prof. Morse Stephens, whose experience in England and at Cornell qualifies him to direct such work on the Pacific coast. The latest accession to the ranks of universities giving official recognition to university extension is Columbia, where an experienced extension man, Dr. Frederick H. Sykes, has organized a system of lectures and classes of exceptional thoroughness. The most remarkable expression of the influence of university extension in America has

come through recognition of the merit of its methods by the Board of Education of New York City, under the direction of Dr. Henry M. Leipsziger, supervisor of free lectures.

Extent Over 1,000,000 people attend the 4,000 or more lectures given in Greater New York annually. This example has been followed officially by Milwaukee, and through private patronage by various other cities.

The numerical significance of university extension in Great Britain and America at the present time is partly indicated by the attendance on the lectures conducted by the University of Cambridge of over 10,000 people annually; London University (which has incorporated the London University Extension Society), over 15,000 people; Oxford, 20,000; the American Society at Philadelphia, 25,000; the University of Chicago, 50,000. These figures represent the attendance at courses of six or more lectures given at weekly or fortnightly intervals.

Not the least significant of the methods of university extension is that of correspondence instruction. This method was employed in Germany as early as 1856 by the School of Languages in Berlin, and in the United States at Chautauqua in 1894. The University of Chicago incorporated these methods in its original organization in 1897, and gives instruction now to over 2,000 students in every state in the union and many foreign countries. Similar work is undertaken by the American Institute of Sacred Literature, Chicago, Pennsylvania State College, University of Wisconsin, Northwestern University, Sprague Law School, Detroit, and other minor institutions, as well as by several large commercial organizations. University extension methods have also been employed by several European universities and organizations, notably in Berlin, Vienna, and Paris.

CHARLES ZUEBLIN.

USURY: Literally means and originally meant *use-money*, the payment of money for the use of money, and sometimes even payment for the use of any article. It was identical with our term interest. Only in modern times has it been limited to mean the taking of inordinate or excessive interest. In this article we consider the ethics of usury or interest-taking. (For economic and other questions, see **INTEREST**; **CAPITAL**.)

Usury or interest-taking among all ancient peoples was considered sin. The Hebrew condemnation of usury is well known: "Thou shalt not lend upon usury to thy brother; usury of money, usury of victuals, usury of anything that is lent upon usury" (Deut. xxiii., 19). This condemnation occurs repeatedly in the Old Testament. (See Lev. xxv., 35-37; Ex. xxii., 25; Neh. v., 7, etc.) Ps. xv., 5, describes the righteous man as one "who putteth not out his money to usury." It is true that the Hebrew could take usury of a non-Hebrew! "Unto a stranger thou mayest lend upon usury" (Deut. xxiii., 20), but this was probably due to the organic and national conception of Hebrew morality. All races originally condemned usury. Herodotus says the Persians repudiated all buying and selling. Yet usury was everywhere practised. In Greece and Rome it gradually developed a plutocracy by putting all the small creditors into the power of the rich, and often reducing the poor to literal slavery. Aristotle ranks usury with prostitution. He says:

Such are all they who ply illiberal trades; as those, for instance, who keep houses of ill fame, and all persons of that class; and usurers, who lend out small sums at exorbitant rates; for all these from improper sources, and take more than they ought ("Nicomachean Ethics," iv., § 1).

Plato says:

Of the two sorts of money-making, one, as I have just said, is a part of household management, the other is retail trade; the former necessary and honorable, the latter a kind of exchange which is justly censured; for it is unnatural, and a mode by which men gain from one another. The most hated sort, and with the greatest reason, is usury, which makes a gain out of money itself, and not from the natural use of it. For money was intended to be used in exchange, but not to increase at interest. And this term usury (*rénes*), which means the birth of money from money, is applied to the breeding of money, because the offspring resembles the parent. Wherefore of all modes of money-making, this is the most unnatural ("Politics," i., 10, 4, Jowett tr.).

Cato, on being asked what he thought of usury, asked the speaker what he thought of murder. Nevertheless, in both Greece and Rome usury was common, and laws were in vain passed against it. The opposition of the Church fathers is well known.

Chrysostom says ("Homily on St. Matthew"):

Nothing is baser than the usury of this world, nothing more cruel. Why, other persons' calamities are such a man's traffic: he makes himself gain of the distress of another, and demands wages for kindness, as tho he were afraid to seem merciful; and under the cloak of kindness he digs the pitfall deeper by the act of galling a man's poverty.

Basil says ("Second Homily on Psalm xiv."):

In truth, it is the last pitch of inhumanity that one man, in the need of the bare necessities of life, should be compelled to borrow, and another, not satisfied with the principal, should seek to make gain and profit for himself out of the calamities of the poor.

Of the man who has borrowed on interest Basil says farther on:

At first a man is bright and joyous; he shines with another's splendor. . . . But the money slips away. Time as it runs on adds the interest to its tale. Now night brings him no rest; no day is joyous; no sun is bright; he is weary of his life; he hates the days that are hurrying on to the appointed period; he is afraid of the months, for they are the parent of interest. . . . Usury is the origin of lying, the beginning of ingratitude, unfairness, perjury.

Such are examples of the position of the fathers. Council after council forbade usury, especially upon the part of the clergy. Yet it grew. It was gradually allowed, even by the canon law under the form of one exception after another. It was, however, still condemned on principle. Protestantism, too, first condemned usury, and often with unmeasured terms. The usurer's house was the house of the devil. One per cent was enough to shut out the kingdom of heaven. Archbishop Sands is quoted as saying, "This canker hath corrupted all England"; Luther as saying, "To exchange anything with any one and gain by the exchange is to steal." Interest was forbidden as late as an act of Edward VI. Beginning with Henry VIII., however, the endeavor was only to control the rate of interest. Calvin was the first Christian thinker to nominally allow interest. Locke, Hume, Adam Smith, and, above all, Jeremy Bentham, argued that it was justifiable. Bentham's celebrated argument was that the effort to condemn and forbid interest simply raises the rate of interest. Men at times must borrow. The lender does a real service to the borrower. Under equity he is entitled to some reward or interest. If all interest is forbidden, he will then secretly ask a higher rate of interest because of the risk run. It is also argued by

those of this school that the attempt to control interest places useless and harmful checks on the natural flow of commerce.

To-day civilization is largely based on interest, and few but the extremest radicals condemn it. To destroy interest, it is argued, would harm the worker and overthrow civilization. On the other hand, radicals who condemn all interest argue that labor of hand or brain is all that men ought to receive pay for, and that he who lends money lends stored-up labor, perhaps, and

therefore should get back what he lends and no more, because, in the loaning, he has himself done no labor. They argue that the power which interest gives to the idler, who has either himself made or inherited money to live in idleness and receive interest from those who toil, is the foundation of social evils, creating classes, developing luxury, enslaving the poor to support the rich. (See INTEREST; CAPITAL.)

V

VACANT LOT GARDENING, or a plan for the relief of the unemployed, or of families in need, began in Detroit, Mich., in 1894, when Mayor Pingree asked for the loan of vacant lots on which the unemployed could be aided to develop vegetable gardens. Four hundred and thirty acres (about 7,000 lots) were given, staked, plowed, and harrowed; 945 families were given seeds with lots of from a quarter to a half acre. About nine tenths of these were well taken care of. The estimated value of the crop produced was some \$13,000, and the cost to the committee, \$3,600. The plan was so successful it was copied in other cities, notably Philadelphia. The movement in that city began in 1896, and after eleven years' continued success, the latest report declares the last year to be the most successful one, with the following summary of results: Gardens conducted for 800 families; total value of product, \$52,000; average value of product per family, \$65; approximate number of men, women, and children receiving benefits from the garden, 4,000. The cost to the Philadelphia Vacant Lots Cultivation Association (R. F. Powell, superintendent, 1123 Land Title Building, Philadelphia) was \$6,616. Similar work is being now carried on in Washington, D. C., New York City, Chicago, Cincinnati, and Cleveland. It is being agitated in Europe, in London and Milan.

VACCINATION: The inoculation with vaccine, or the virus of the cowpox, as a preventive of the smallpox. Dr. Jenner, an English physician, discovered the process of vaccination in 1796. One illustration will suffice to prove its beneficial result. The cases of smallpox in New York City were: 1808—12; 1899—54; 1900—132; 1901—1,198. Jan., 1902—190; Dec., 1902—9. Of the 1,396 cases from 1808—1901 nearly one third, or 410, ended fatally. Then the Health Department bestirred itself and tried to stop the rapid increase of the disease; 200 vaccinators were appointed for special service; they went to schools, factories, houses, and vaccinated about 800,000 people in six months. It required some money, but the disease and its ravages were stopt.

Vaccination does result fatally, however, in some cases. This is due to the fact that the vaccine is impure, that the instruments used are not treated antiseptically, or that the blood of the patient is in very poor condition. There is an Anti-Vaccination Society in Great Britain. Nevertheless, the governments of civilized countries make vaccination obligatory.

Charities and the Commons, of Oct. 12, 1907, says: "The contrasted experience of the two great empires of Germany and Russia affords conclusive evidence on this question. Compare

the figures of a single year as taken from the official records of each of these nations. In 1904, in Germany, having enjoyed the blessing of compulsory vaccination for nearly thirty years, only 189 cases of smallpox, of which twenty-five were fatal, occurred. More than a quarter of these were imported from neighboring countries. In Russia, where free vaccination is offered and where every possible safeguard is thrown around the operation, and no expense is spared to educate the people as to its advantages, but where it is not compulsory, during the same year, 103,717 cases of the disease occurred with 48,390 deaths. In Germany the average annual death-rate per million of population for a five-year period was 1.1, while in Russia it was 463.2. Our people, like those of Russia, are far from having reached such a state of civilization that they can be relied upon to willingly and voluntarily accept universal vaccination."

VAGRANCY (TRAMP, ETC.): Vagrancy is a national problem. Thus far its treatment has been almost always local. The vagrant is the most elusive of all applicants for charity; in consequence, charitable aid for the vagrant has generally taken the form of wood-yards, wayfarers' lodges, municipal lodging-houses and missions. The vagrant's crimes are petty, and often not discovered; as a result both courts and citizens have looked upon him more as a nuisance or as a pitiable object, than as a criminal or a potential malefactor. He has been "moved on," or committed to jail for a few days with little labor, if any, or he has wintered in the workhouse or almshouse.

The question of vagrancy has concerned England and European countries for many years. England, with an army of the unemployed, and with time-worn treatment of vagrancy by casual ward, workhouse, and short-term sentence, has recently received the recommendations of its Vagrancy Commission, which, after months of investigation in England and in Continental countries, has reported to both houses of Parliament that present methods of treating vagrancy should be coordinated, strengthened on the side of repression, and supplemented by the establishment of compulsory labor colonies. In Germany, a generation ago, the prevalence of vagrancy and begging precipitated questions similar to those we are now asking, at least in some of our Eastern states; as a result, way stations were established for wayfarers, home inns for "overnight," and volunteer farm colonies for more permanent treatment. (See RELIEF STATIONS; LABOR COLONIES.)

Of the number of vagrants in any country no

man knows. In the United States the vagrant largely lives on the railway, at least during the summer months. "Railroads representing more than half the total mileage operated in the U. S. and Canada testify almost without exception to depredation, thieving, injuries,

Extent of Problem

deaths, accidents to passengers or rolling-stock, enormous aggregate costs to railroads or society, caused by the habitual illegal use of the railroads by vagrants." The number of "trespassers," from one half to three quarters of whom are vagrants, who are killed annually on American railroads, exceeds the combined total of passengers and trainmen killed annually. Within four years 23,064 trespassers were killed and 25,236 injured, thus furnishing the enormous total of 49,200 casualties, with all the cost they involve. If we may judge the number of vagrants by the number killed in the same proportion as the number of railway employees killed to the total number, it brings the number of vagrants in the U. S. to some 500,000. Major Pangborn, representing President Murray of the Baltimore & Ohio, stated with deliberation that railroads frequently maintain private graveyards along their right of way, in which to bury vagrants killed by trains while trespassing; \$25,000,000 would be a conservative estimate, according to Major Pangborn, of the direct and indirect annual financial losses to railroads in the U. S. through railway vagrancy.

To attack vagrancy effectively, the main principles of a consistent program must be followed by all communities. During the last two years Massachusetts has waged an effective vagrancy campaign, because the entire state has been made the unit of activity. In consequence, the number of vagrants in Massachusetts has diminished remarkably; but probably there are now more vagrants in contiguous states. No city or state can live unto itself alone in a thorough treatment of vagrancy. New York City has recently adopted excellent lodging-house regulations, which will increase the price of the cheapest beds. Yet in the absence of a mendicancy squad in New York City, vagrants can still ply their trade in New York, and commute by ferry to the unsupervised ten-cent lodging-houses across the river in Hoboken, Jersey City, and Newark.

At the National Conference of Charities and Corrections (1907) a committee was appointed to create a national committee upon the question. (See also UNEMPLOYMENT.)

VAIL, CHARLES HENRY: Economic writer; born Tully, N. Y., 1866; educated at St. Lawrence University, and entered the ministry in the Universalist Church; has held pastorates at Albany, N. Y., Jersey City, N. J., Richfield Springs, N. Y.; now pastor of Pullman Memorial Church, Albion, N. Y. Mr. Vail believes in the collective ownership of the means of production and distribution. Author of "National Ownership of Railways," "Modern Socialism," "Principles of Scientific Socialism," "The Socialist Movement," "The Mission of the Working Class," "The Negro Prob-

lem," etc. Address: 141 South Main Street, Albion, N. Y.

VAILLANT, MARIE EDOUARD: French Socialist; born in 1840 at Vierzon, France. He became a student of the *École Centrale des Arts et Manufactures*, and a civil engineer in 1862; also a physician and surgeon. He was a member of the Commune in 1871, and has been prominent as a Socialist ever since; elected to the Municipal Council of Paris in 1884, and as a deputy in 1893, he became a leader of the *Parti Ouvrier*, and now of the United French Socialist Party, and as such was elected again a deputy in the last election.

VALUE (from Latin *valere*, to be strong, to be valiant, to be worth): A term sometimes loosely used, even by economic writers, to include the worth of an article measured in any way. It is, however,

Definitions increasingly used in economic science in a narrower sense to mean what a commodity will bring in exchange for other articles. Adam Smith, even in his day, clearly differentiated between value in use, or the utility of an article to its possessor, and value in exchange, or what an article will exchange for in the market. This distinction is fundamental, and is observed by all economists. Air, for example, has great value in use. Man cannot live without air. But air has ordinarily little exchange value. Diamonds, on the contrary, with a low use value, have great exchange value. In modern terminology, however, value in use is usually called utility, and by value is simply meant value in exchange.

It is still necessary, however, to distinguish value from the cognate words "price" and "cost."

"Price," says Professor Fawcett, "is a particular case of value." Value is what an article will exchange for. Price is what an article will exchange for in money (*q. v.*).

Cost is different from either value or price. Cost may be defined as the sum of sacrifices of any kind involved in the production of an article. Articles frequently sell for much more or for much less than for the cost to produce—that is, their value and their price are different from their cost.

Remembering these definitions, we now come to consider the important and much-discussed question of the theory of value. We may recognize two main theories of value. The value of an article is believed by one school to depend upon its cost of production, and by the other to depend upon its utility. Adam Smith, Ricardo, the classical economists, most German Socialists, and most individualistic or anarchistic radicals hold to the former view. Professor Hadley ("Economics," p. 93) calls it the socialistic theory. On the other hand, most modern economists and most Fabian Socialists hold to the latter view. Both views, however, it must be remembered, have been variously stated.

Adam Smith held that value must tend to the cost of production, because he argued that no man could afford to sell an article

Cost Theory for much less than it cost to produce, while no man would pay much more, since he would rather produce it or cause it to be produced himself. He says ("Wealth of Nations," bk. i., chap. v.): "Labor, therefore, is the real measure of the exchangeable value of all commodities. The real

price of everything, what everything really costs to the man who wants to acquire it, is the toil and trouble of acquiring it."

The followers of Adam Smith very much developed this view, but spent more time in analyzing it than in asking if it be true. Ricardo makes value depend upon the quantity of labor and the scarcity of the articles; but since most articles can be easily multiplied, he makes the quantity of labor the main source of value. Mill calls attention rather to the wages cost of labor than the quantity of labor. Cary makes the important point that value depends on what it would cost to reproduce an article at the time of its sale rather than on what it originally cost. Such are the main points as to value developed by the classical school.

From this view Karl Marx and most German Socialists argue that labor (of mind or hand) being the only source of value, only the laborer should share in the result. That portion of value produced which goes to the capitalist Karl Marx calls surplus value robbed from the real producer. Hence such Socialists argue that if the community owned all the land and capital, the monopolist could not take from the laborer any portion of the product, and the laborer would receive the whole value of his product. Anarchists and extreme individualists would get the same result by doing away with the governmental control of monopolies which secure the monopolists in their monopoly, and, leaving every man free to obtain land and capital, secure to every worker the value he produces.

We now come to the second school. It is now denied by most economists that value depends upon cost of production, and that labor is the only source of value. As a matter of fact, value, says the modern school, has often very little relation to the cost of production. A certain quack medicine that happens to hit the public fancy can often command prices bearing no reference to the cost of production. Houses continually sell for prices often much above and often much below their cost of production; so with books, so with wines, so indeed with most things, even including such stable articles as grain, iron, etc.

Utility Theory

The old theory therefore does not explain the facts, and a new theory must be developed. Jevons was the first prominently to develop the new theory, which is often associated with his name. According to this theory, the value of an article depends upon its final utility. According to this, the value of an article depends upon how useful to the community another article of the same kind would be. If the community desires more medicine, more houses, more books, more jewels, more bread of a certain kind, the price is high; if the community does not desire more, the price falls. Says Jevons ("Theory of Political Economy"):

A great undertaking, like the Great Western Railway or the Thames Tunnel, may embody a vast amount of labor, but its value depends entirely upon the number of persons who find it useful. . . . Labor once spent has no influence on the future value of any article; it is gone and lost forever. In commerce by-gones are forever by-gones; and we are always starting clear at each moment, judging the value of things with a view to future utility.

Such, in brief, is Jevons's view. His phrase, however, has mainly given place to another. The Austrian, Professor Wiesner, has given us the phrase marginal utility in place of final utility, as indicating the utility of an article on the margin of production—i. e., on the margin of doubt,

whether it be worth while to produce it or not, since it is when one is debating whether it is worth while to obtain an article or not that its value is fixed. This theory, indeed, has been mainly developed by the Austrian school of economists, the more recently American economists have carried the theory even further than the Austrians. This has led to what is sometimes called psychologic economics. If value depends on how much the community desires an article, it follows that value is affected by all the psychologic elements which affect desire.

This view, too, now widely accepted, is accepted by some socialists, and especially by most Fabian Socialists. They come to the same conclusions as German Socialists, but not on the ground that labor is the only source of value or that cost determines price. They base their socialism mainly on grounds of expediency (see SOCIALISM), and argue that just because value is determined, in part, by the whims and desires of society, it is not wise to leave the individual worker subject to the whims and caprices of a changing market. In conclusion, Ruskin's view, which plays more or less into the psychologic view of the modern holders of the utility theory, must not be forgotten. He says ("Munera Pulveris," chap. i., § 12):

Value signifies the strength or "availing" of anything toward the sustaining of life, and is always twofold; that is to say, primarily, intrinsic, and secondarily, effectual. . . . Value is the life-giving power of anything; cost, the quantity of labor required to produce it; price, the quantity of labor which its possessor will take in exchange for it. . . . Intrinsic value is the absolute power of anything to support life. . . . It does not in the least affect the intrinsic value of the wheat, the air, or the flowers, that men refuse or despise them. Used or not, their own power is in them, and that particular power is in nothing else. But in order that this value of theirs may become effectual, a certain state is necessary in the recipient of it. The digesting, breathing, and perceiving functions must be perfect in the human creature before the food, air, or flowers can become of their full value to it. The production of effectual value, therefore, always involves two needs: first, the production of a thing essential, useful; then the production of the capacity to use it. When the intrinsic value and acceptant capacity come together there is effectual value or wealth. Ruskin's view, then, is (see "Unto This Last") that all labor should be equally paid, and thus the good workmen be rewarded not by higher pay for a given piece of work, but by being more in demand and in this sense better paid. Thus valuable work will be produced, and there will be no competition to get "cheap" work.

REFERENCE: See POLITICAL SCIENCE.

VARLEZ, LOUIS: Professor at the Industrial School of Ghent; doctor of laws, and of science; born at Antwerp, Nov. 26, 1868; entered the university and studied law. He practised for a few years, then began to study the question of providing work for the unemployed of different classes. He originated the so-called Ghent system (see article UNEMPLOYED), which has been adopted in Belgium, Germany, Holland, France, etc. Professor Varlez is a member of numerous societies which work for social betterment; also of the International Institute for Statistics. Address: Ghent, Belgium.

VERINDER, FRED: English land reformer; born in Bethnal Green, 1858. He was one of the founders and the first secretary of the Guild of St. Matthew (*q. v.*). He was long subeditor of the *Church Reformer*, secretary of the English Land Restoration League, and organizer of the Red Van movement. He is now secretary of the English League for the Taxation of Land Values, 376-377, Strand, W. C., London.

VERRIJN, STUART COENRAAD ALEXANDER: Professor of economics and of industrial law at the Academy of Technology at Delft; born

1865 at Weesp, Holland. He received the doctor's degree in law and political sciences at the University of Amsterdam in 1890, and was appointed instructor in economics at the School of Commerce the same year. He was also one of the directors of the Statistical Institute—a private institution founded by the Statistical Association in that city. In 1892 he became secretary of the Central Commission of Statistics at The Hague, and in 1899 was appointed director of the Central Bureau of Statistics—a government institution founded on the reorganized Central Commission.

In politics he is a liberal. In respect to the social question he believes that the amelioration of social conditions depends more on the mental and moral improvement of the working men themselves than on the interference of the state. Author of numerous articles and papers in various periodicals, mostly in the Dutch language; a few of them dealing with the relation between the theories of classical economy and those of Marx. Address: Delft, Holland.

VIENNA: Imperial royal capital of Austria-Hungary, and of Lower Austria. It dates back to the Roman camp *Vindobona*, which was erected owing to the strategic position of the place—on the Danube where the spurs of both the Alps and the Carpathians almost meet. When the Romans withdrew in the fifth century, the settlement became the prey of various peoples until the twelfth century, when Margrave Leopold, the Saint, restored it, and made it his capital. Since that time Vienna has shared all the vicissitudes of the Austrian monarchy; being twice besieged by the Turks, and once nearly taken, 1683. During the reign of Maria Theresa and Joseph II., in the eighteenth century, the city received a number of prerogatives, and its population has since grown steadily, viz.: 1800—231,050; 1840—356,700; 1857—476,222; 1869—607,514; 1880—704,756; 1890—817,299; or with the incorporated suburbs, 1,341,897; 1900—1,648,335, plus 26,622 soldiers.

For administrative purposes the city is divided—since 1900—into twenty districts or wards, each of which enjoys a certain independence. The burgomaster and two vice-burgomasters are at the head of the municipal authorities, and are restricted in certain ways by the governor of Lower Austria and by the emperor. The Communal Council consists of 158 members, elected for six years in four groups. In 1900 there were seventy Christian Socialists, eighteen Liberals, and two Socialists in this body; this is the legislative body with the prerogative of initiative. The twenty-two aldermen form, with the burgomaster and the two vice-burgomasters, the executive body; they appoint and supervise all officials; they are elected by and from members of the Communal Council. The number of officials under their supervision was (1900) 2,471 with salaries aggregating 6,500,000 kronen—\$1,300,000. The city is supplied with excellent water from the mountains, which is conducted in some cases at a distance of 95.5 kilometers by means of aqueducts, one of which is twenty-five meters high. The total cost of the plant was, up to 1900, 127,320,000 kr. There are six municipal abattoirs, which draw chiefly from the central market of St. Marx, covering thirty-one hectares. In 1900 there were killed 279,670 cat-

tle, 207,362 calves, 563,302 hogs, 62,285 lambs, 107,764 sheep, 24,618 horses, and 23 donkeys.

The finances of the city are good. Property in 1900: 360,314,766 kr.; debts, 308,806,446; revenues: receipts, 164,663,076 kr.; expenditure, the same. The city made handsome profits on its transportation system, 4,422,047 kr.; non-navigable watercourses, 2,816,769; canalization, 2,173,557; markets, 1,701,502; cemeteries, 1,124,303; water tax, 6,069,367. The principal occupations are: Clothing industries, 202,437 people; commerce, 137,318; transportation, 106,355; woodworking, 86,013; court, state, and city officials, 86,082; own income, 85,301; various trades, 85,512; iron and steel, 62,119; building trades, 60,816; food, 46,438; textiles, 36,783; professions, 32,784; paper and leather, 29,576.

The city has a large commerce in grain and cattle, and is excellently served by railroads and several steamship lines. The railroad depots have recently been connected by means of a belt line. Numerous banks, particularly the Austro-Hungarian, facilitate commerce and assist industries; there are 94 savings-banks and loan associations; 21 *Konsum-Vereine* with 64,727 members and 4,710,000 kr. assets; 90 cooperative societies with 9,373 members and 25,610,000 kr. assets. The four municipal savings-banks have 574,588 depositors and 542,980,000 kr. deposits. Life- and accident-insurance is taken care of by 25 companies; besides numerous sick-benefit organizations. There are 46 hospitals for various kinds of diseases; 20 orphan asylums; 3 houses of refuge for vagrants and poor (1900—88,493 inmates), etc. Over 800 benevolent societies with more than 50,000 members minister to various and numerous needs of the sick and poor. The 9 city poor funds had an income of 7,056,110 kr.; 6,479,684 expenses, and property worth 40,920,000. The 1,343 institutions for the poor have 21,380,000 kr. property with 878,348 kr. income. About 65,500 persons received 463,900 kr. from public funds, and 83,430 persons 985,014 kr. from private funds in temporary relief; 21,815 persons received 3,187,978 kr. in the form of annuities. There are 27 baths, 13 of which are public and municipal.

The city has numerous and excellent schools, libraries, churches, opera-houses, theaters, museums—advantages which bring nearly 500,000 visitors to its hotels every year. Since the tearing down of the old walls around the inner city, Vienna possesses an excellent system of parks, which, added to the politeness and bonhomie of the inhabitants, form strong attractions to many Continentals and Englishmen.

VIVIS, LUDOVICO: A Spanish philanthropist who flourished in the first half of the seventeenth century. He dreamed of a sort of Utopia, and in 1635 wrote a book about it, which he called "*De Commune Rerum*."

VOGEL, SIR JULIUS: Twice Premier of New Zealand and spoken of as her "institution builder"; born in London, 1835; educated at London University and the Royal School of Mines. He went to Australia to practise his profession; in Melbourne was soon elected to the Provincial Council and became head of the provincial government. He soon, however, went to New Zealand, was elected to the House, and became Colonial Treasurer (1869), later Postmaster-General,

Municipalism

municipal abattoirs, which draw chiefly from the central market of St. Marx, covering thirty-one hectares. In 1900 there were killed 279,670 cat-

then leader of the House, finally Premier, 1873-1875, and again in 1876, when he resigned because of ill health. From 1876-81 he was Agent-General for New Zealand. Altho a Conservative, he introduced in New Zealand the nationalization of railways, the public-works policy, government life-insurance, the public-trust office, the Australian ballot, with other important measures. He died in 1899.

VOLLMAR, GEORGE von: German Socialist; born Munich, 1850, of aristocratic family, and educated by the Benedictine fathers. He entered the cavalry in 1865, and went through the Austrian campaign. He then offered his sword to the Pope, but joined the Bavarian army in the Franco-Prussian War. Wounded and crippled for life, he set himself to complete his education, and left the hospital a Socialist. He edited a Socialist paper in Dresden. Banished by Bismarck's anti-Socialist law, he spent his exile in France and Switzerland. In 1881 he was elected to the Reichstag, but was arrested and again banished. In 1884 and in 1890 he was returned for Munich. He is the main leader of socialism in Bavaria, the first lieutenant of Bebel and Liebknecht, and belongs to the more conservative German Socialists. In 1891 he published "Ueber die, nächsten Aufgaben der deutschen Social Demokratie."

VOLUNTARYISM is a system of social thought developed by Mr. Auberon Herbert (*q. v.*), and advocated in his paper *Free Life*. Mr. Herbert says:

Voluntaryism asserts the sovereignty—the self-ownership—of the individual; denies that the State, which is but a collection of individuals, possesses any larger right to use force than the individual possesses, and, therefore, opposes all force-action on the part of the State, except for the one purpose of maintaining individual self-ownership by protecting person and property against violence and certain coarse forms of fraud. *The Free Life* opposes all force-action by the State in matters connected with religion, education, health (except where person or property is injured by an aggressive act), the professions, labor, insurance, poor-law, trade, banking, drink, morality, marriage, and the taking of money for public purposes.

The Free Life believes in the weapons of reason, persuasion, and example; believes in the infinite development of ideas and of human resource and invention, where men are left free; believes in a society based upon the friendly exchange of voluntary services, and not in State-made virtues or in legal persecutions of each other, or in coercion of minorities by majorities, or in the bribery of politicians of their supporters out of private property or the common compulsory fund. It is opposed to all forms of pensions and official vested interests; it denounces all public debt as fatal to prosperity and most unrighteous as regards our successors; it would sell public property and make every voluntary effort in order to get rid of existing debt, but refuses all responsibility for any debt, central or local, incurred after the year 1893.

VOLUNTEERS OF AMERICA, THE: Founded in 1896 by General and Mrs. Ballington Booth. The organization adopts a military discipline, combined with a democratic constitution. It has nearly one hundred self-supporting posts and companies, exclusive of the philanthropic and sociological centers.

The Volunteer Prison League, organized by Mrs. Ballington Booth (1895), has branches in twenty-two state prisons and embraces 40,000 men. By correspondence and speech, this league is in touch with tens of thousands of men and women all over the country for their moral and spiritual betterment. It has established three Hope Halls (homes for released convicts until they can procure work), at Flushing, L. I., Fort Dodge, Iowa, and Chicago, Ill. Seventy-six per cent of those passing through these homes have done well.

In connection with the above, there are many philanthropic branches of work, such as employment bureaus, wood-yards, industrial departments, cooperative stores, the work of renovating second-hand furniture, supplying of coal, distribution of milk, women's sewing classes, reading-rooms, hospital nursing, fresh-air camps, distribution of clothing, and many other benevolent and needed efforts that are too numerous to mention.

The following is a statement by General Ballington Booth of the work for 1906, furnished for the Encyclopedia:

The eleventh year of our work has not been a backward one in the cause of philanthropy under the Volunteer standard. In connection with our Central Homes and Institutions, there have been 362,812 lodgings provided. There were 480,218 free meals given, and 275,084 paid meals, making a total of 755,302 meals. These are apart from the many thousands of meals provided at Thanksgiving and other seasons of the year.

Some idea of the magnitude of the work of the Volunteers in the prison world is shown in the fact that since its organization there have been registered in the Volunteers' Prisoners' League 60,000 members. The league is now established in twenty-seven penal institutions, but in addition to the above figures many hundreds of the men and their relatives and wives are in touch with the league by correspondence and visitation, and the moral and spiritual uplift reaped amid the poverty and temptation of our great cities has considerably grown.

Perhaps no phase of the Volunteer work has more forcibly demonstrated its need than that of the hospital work. In all 17,260 outdoor and dispensary patients have been treated during the last year; 47,819 visits have been made by patients to the dispensary alone; 40,286 individual cases were treated in the hospital and dispensary since June 9, 1905—a total of not less than 114,785 cases.

In conclusion, let me add that it would be little short of a serious oversight for me to overlook the fact that the indefatigable labors of the officers and workers of the Volunteers of America have resulted in the truly encouraging report that we have reached over 4,000,000 hearers.

President: Ballington Booth. *Address:* 34 West Twenty-eighth Street, New York, N. Y.

W

WADSWORTH, JOHN: Member British Parliament, of Labor Party for Hallamshire, West Riding, S. Yorkshire; born 1850; worked in the mines at Thorncliffe and Wombwell as miner and check weighman. He was elected secretary, president, and delegate for the Wharnciffe Silkstone branch of the Yorkshire Miners' Association and is now secretary of the Association. He was elected to Parliament in 1906 chiefly by the votes of the Miners' Association, assisted by the Liberals. *Address:* 2 Huddersfield Road, Barnsley, England.

WAGES (see also HOURS OF LABOR; MINING; RAILROADS; WOMAN'S WAGES): We consider the subject of wages under three heads: I. The Asserted Laws or Theories of Wages; II. The Statistics of Wages; III. Real Wage Conditions; are they improving or not?

I. THE LAW OF WAGES

There have been six main theories presented as to the law or laws governing wages. Various

stated by different writers, they are substantially as follows:

A. THE WAGE FUND THEORY

This theory, suggested by Adam Smith and developed by his followers, is given up to-day by all economists in its original form, tho some, like Professor Taussig, of Harvard University ("Economics," 1896), assert that it contains valuable truth, and when properly stated is wholly true. As originally stated it is this: Wages, like everything else, are governed by supply and demand, and in the aggregate depend upon the proportion of laborers to the capital available for employing labor, this capital being denominated a wage fund. Adam Smith says ("Wealth of Nations," book i., chap. viii.):

The demand for those who live by wages, it is evident, cannot increase but in proportion to the increase of the funds which are destined for the payment of wages.

This hint his followers developed. Malthus and Ricardo hold the same, but argue that wages cannot rise, even by increasing the wage fund; because if the wage fund is increased and wages be temporarily raised, population, according to Malthus, always pressing on the limits of subsistence, will be enabled to expand, and the increase in the number of laborers will increase the supply relatively to the wage fund, and therefore lower wages. Ricardo says ("Principles of Political Economy," chap. v.):

By the encouragement which high wages give to the increase of population, the number of laborers is increased, wages again fall to their natural price, and, indeed, from a reaction, sometimes fall below it. . . . The natural price of labor is that price which is necessary to enable the laborers, one with another, to subsist and to perpetuate their race without either increase or diminution. . . . The market price of labor is the price which is really paid for it from the natural operation of the proportion of the supply to the demand; labor is dear when it is scarce, and cheap when it is plentiful. However much the market price of labor may deviate from its natural price, it has, like commodities, a tendency to conform to it.

Similarly argue Senior, James Mill, John Stuart Mill, and most of the older writers of this classical school, tho on this subject, as on others, Mill later somewhat modified his views, and is often inconsistent.

This wage-fund theory naturally leads to and did historically lead to

B. THE GERMAN SOCIALIST THEORY OF THE IRON LAW OF WAGES

According to this theory, wages under competition can never be higher than that which will just support the laborer and enable him to renew his kind. The theory directly follows, its holders argue, from the wage-fund theory as stated by Ricardo. It is true that Ricardo himself did not hold this theory, sometimes fathered upon him. He held that the condition of the laborer could be raised by education, if he could be taught by moral ways to avoid overpopulation; but the German Socialists claimed that under the intense struggle to live the laborer could not be sufficiently educated, and that the only way was to stop the competition and introduce a socialism which would lead to education rather than to depend on education to lead to socialism. The economic condition, they argued, is the key to all else, and civilization creeps on its belly. Hence they argued that under competi-

tion, by an iron law (Lassalle's phrase) the condition of the laborer can never be one of more than mere existence, and the only change for improvement is to replace the competitive system by socialism.

But now a new theory arose—

C. THE THEORY THAT PRODUCTION FURNISHES THE TRUE MEASURE OF WAGES

This theory, first clearly advocated by President Walker ("Wages Question," 1876), argues that the wage-fund theory and its socialistic corollary are wholly false, and wages depend upon the productivity of labor. Wages, it says, are not dependent upon capital, because men without capital can and often do employ labor, provided they can know that the laborers employed will produce enough value to enable them to pay the laborers out of the product and leave a balance for the employer. Employers are able to do this—as often on a farm—by giving the laborer merely his board till the harvest comes, and then paying him more out of the harvest his labor has produced. Or he can do it by borrowing capital, provided out of the product of labor he can pay for the capital borrowed, the laborers themselves, and leave a profit for himself. Hence wages depend on product. Says President Walker ("Wages Question," chap. viii.):

The popular theory of wages . . . is based upon the assumption that wages are paid out of capital, the saved results of the industry of the past. Hence, it is argued, capital must furnish the measure of wages. On the contrary, I hold that wages are, in a philosophical view of the subject, paid out of the product of present industry, and hence that production furnishes the true measure of wages. . . . The employer purchases labor with a view to the product of labor, and the kind and amount of that product determine what wages he can afford to pay.

This view has been very widely accepted in both England and America. Writers like Edward Atkinson have accepted it, arguing that the only way to raise wages is to raise the product.

Capital must be paid first, Mr. Atkinson argues, in order to induce it to contribute; but it is only paid just what is necessary in the market to obtain it, and the rest of the product goes to wages. The relative share of capital, it is claimed, will fall, because as wealth increases the competition of capital will grow more and more, and thus lower the rate of interest, and leave more of the product to go to the laborer. Interest is lowest, it is argued, in the wealthiest countries, and wages are there highest. Machinery increasing, the product increases; therefore, the share of the laborer. Such is, in brief, the roseate theory held to-day by many economists and most capitalists. But few working men or radicals accept it. They argue that the facts do not support the theory. They say it is true that the rate of interest is lowest in richest countries, but that the very competition of abundant capital and temporary rise of wages force capital more and more to employ machinery, and that on a large scale, thus tending to make the laborer, and especially the skilled laborer, less and less necessary, and so throwing on the market an increasing number of unemployed laborers, whose competition tends to lower wages, and leaves the employer with a low rate of interest, to yet accumulate large profits by multiplying small rates of profits in large concerns. The falling in the rate of interest does not show, say these critics, a falling in the share of capital. Capital gets its share, not only interest,

but in dividends, and dividends in large concerns may be very high where interest is low. Wages, then, do not, so these critics urge, necessarily rise and fall with production, but are often lowest when production is highest, because a so-called overproduction discharges laborers and materially lowers their income. Were it not for trade, they argue, wages might be very low with production very large.

D. THE THEORY THAT WAGES DEPEND UPON THE STANDARD OF LIVING

This theory, born of the so-called eight-hour philosophy (see EIGHT-HOUR PHILOSOPHY), held to-day by most American trade-unionists, except those who are Socialists, and developed at length by Mr. George Gunton (*q. v.*) in his various writings, argues that wages depend upon what the workman considers the lowest level upon which he can live. Competition, it argues, can reduce wages to the lowest limits he will work for, but not lower, because he will then starve rather than work, or so strenuously organize that wages will have to rise. What he will work for depends upon the standard of living in the different countries and trades concerned. An American will starve or strike rather than accept Chinese wages, because the American standard of living demands higher wages. The price of labor, like all other commodities, depends on the cost of production. A skilled laborer receives more than an unskilled, because it costs more to produce and maintain him in the standard of living necessary to his being a skilled laborer. A Chinaman receives low wages, because he will live in a low way. Wages in crafts which cannot be prosecuted all the year are per day higher than those in crafts which can be prosecuted all the year round, because in a portion of the year the laborer has to earn enough to keep him all the year. Wages in trades where the wife and child as well as the man habitually work (as in the cotton trade) are lower than trades where women and children do not work, because the wage of the wife and child, supplementing the man's wage, enables the family to maintain the standard of living of their class without the man's wage alone equaling that amount. City wages are higher than country wages, because it costs more in the city to live on the same plane of living as in the country. Wages in piece-work are in the long run the same as in day-work, because under competition the employer cannot pay higher wages than the workman can be obtained for, and under competition the workman will always work under any system for that which will enable him to secure the standard of living he considers necessary. All these cases show, argue the holders of this theory, that wages in any country and in any trade depend, not, as the Socialists say, on what will just support and renew the laborer's life, but on what will maintain and renew his life according to the standard of living he considers necessary. The one way to raise wages, therefore, argues this school of thought, is to raise the laborer's standard of living.

But this theory, like all the others, has its critics. It is argued that, however hard the laborer tries to maintain his standard, men will lower their standard rather than starve, and that when machinery discharges men, men will work for wages which will support life even far below the standard of living in their trade and country,

and hence, by their competition, lower all wages. In some skilled trades intelligent workmen, by labor combinations, may long keep up their standard of wages; but unskilled laborers cannot. Wages thus, say these critics, do not so much depend on the standard of living as the standard of living depends on the wages men can secure.

E. HENRY GEORGE'S THEORY OF WAGES

Henry George says ("Progress and Poverty"):

Wages depend upon the margin of production or upon the produce which labor can obtain at the highest point of natural productiveness open to it without the payment of rent.

Wages cannot be lower, he argues, than men can get by working for themselves, without paying rent, because men prefer to work for themselves, and will only work for an employer provided he will pay more than they get by working for themselves. On the other hand, Mr. George also argues, employers will not pay more than just enough to secure the laborer, because under competition they cannot pay more than they have to. If they do pay more somebody else will pay less, and so be able to undersell them, and force them to pay lower wages.

Therefore the one way to raise wages, according to Mr. George, is to give men opportunity to labor without paying rent.

But this theory, in its turn, is contradicted by the facts. Wages are not the highest where there is most free land, but where there is least. Wages are highest not in the center of Africa, but in New York City. If it be said that in Africa the laborer gets a larger proportion of his produce than in New York City, it may be true, but nine tenths of thirty cents is less than three tenths of \$3. The presence of capital and machinery enables the employer to pay not only higher, but much higher wages than the employer can make on land without capital at the margin of production. It is true that the competition of labor tends to lower wages, but the mere opening of opportunities in land cannot check this competition, because in civilized countries land without capital is useless, or so nearly useless that those with capital can afford to pay very much more for it than a man without capital, and hence in the open market will get the land, whether the price be paid to the landlord, as under the present system of land tenure, or to the government, under the single-tax plan. It may be said that this will force all land to be used by those who can use it best, and so employ labor and raise wages; but with machinery constantly improving in agriculture, as in all trades, the laborer grows less and less necessary to the employer, and the competition of the laborer, replaced by machinery, can lower wages under a single-tax system as well as under any other form of land tenure. Wages, therefore, do not depend on access to land. (See SINGLE TAX and objections.)

F. THE THEORY THAT WAGES DEPEND, AS IN ANY OTHER CASE OF VALUE, ON THE MARGINAL OR FINAL VALUE OF THE LABORER

(For a full statement of the marginal or final value, see VALUE.) This theory is rather a way of looking at things than the statement of a definite law. It simply states that no one law of wages exists; that wages depend on the value to

the wage-payer of the laborer he is considering—i. e., on the margin of employing. Each worker will get what his labor is worth to the employer at the time when his wage is decided upon. What the laborer is worth depends upon the state of the market, the ability of the laborer, the standard of living, psychological conditions, etc. The theory, therefore, simply states that no definite law of wages can be laid down. It is undoubtedly a great advance on any other, because it is undoubtedly true that wages are the resultant of many forces. All the above laws of wages contain elements of truth. Those who argue that wages depend on production are fond of declaring the wages-fund theory exploded; but, as Professor Taussig says ("Wages and Capital," p. 37):

In whatever sense we use the term capital, it will still appear that current wages, considered with reference to any but a very short period of time, are derived in the main from capital.

Thus the wage-fund theory has some truth. The Socialist theory has some, for under competition, without organization, wages do tend to what will just support life. So with all the theories. The standard of living, the margin of production, the productivity of labor, do all affect wages. Wages are the resultant of many economic forces. This seems to-day all that economy can say.

II. STATISTICS OF WAGES

A. THE UNITED STATES

The best general statements of wages in the United States are undoubtedly those of the U. S. Bureau of Labor. (See, however, Section III.) We quote from the latest statement of the bureau as to wages (*Bulletin* of the U. S. Bureau of Labor, July 1907). It must be remembered, however, that these returns are only for manufacturing, and even in that only report for the large industries and in the main the larger establishments, a result necessitated by the expense and difficulty, amounting to impossibility, of covering the whole field, and particularly the scattered industries, those most irregular and least organized, such as agriculture, mining, and commerce, and the smaller industries and establishments. But this means that the low wages of perhaps a majority of the people do not appear in these returns, as in agriculture, mining, and the unorganized trades, great department stores, and multitudinous small stores and workshops. The returns, therefore, tho doubtless true of the facts investigated, are of necessity limited for the most part to the higher conditions and therefore give an unduly favorable view for the whole of industry. The report says:

In making the investigation of rates of wages and hours of labor, the design has been to cover the principal distinctive wage-working occupations in the leading manufacturing and mechanical industries in the U. S. with a view to securing data that would be representative of conditions and show the trend of wages and hours of labor. The investigation covers those industries in which the wages paid in the U. S. in one year were \$10,000,000 or over as shown by the census of 1900. The office and field force available for the prosecution of the work has not admitted of the extension of the investigation to cover transportation, mining, agriculture, and the other great industrial groups.

The hours of labor given in this report represent the regular full-time hours of the occupation—that is, the time that the employees as a class were engaged in work. No account has been taken of time lost by individual employees because of a desire not to work, of bad weather, or of slack work. It is no part of the purpose of this article to measure the amount of unemployment, and it must not be inferred that all employees engaged in the establishments reported in this article worked full time. . . .

¹ Increase.

² Not reported.

In studying these tables of wages, the explanation at the beginning must always be remembered. *They are only true of the more highly organized industries.*

Yet, according to the census (vol. "Employees and Wages," p. 616), 11 per cent of the male workers over sixteen years of age in the New England cotton-mills receive less than \$300 per year. Dr. Peter Roberts says that 60 per cent of the workers in the anthracite coal region do not receive \$450 per year ("Anthracite Coal Communities," p. 346). Robert Hunter says that the mass of unskilled workers in the North receive less than \$460 a year and in the South less than \$300 ("Poverty," p. 53).

In computing the figures for the summary for the U. S., each industry has been given a weight in proportion to the amount of wages paid therein, as shown by the U. S. census of 1900. This was deemed to be the most equitable method of making allowance for the greater or less importance of the several industries. The agricultural implement industry is an important industry, but by no means so great as the building industry of the country; therefore allowance for the importance of each industry was deemed necessary, and the most satisfactory method of weighting is believed to be the weighting in proportion to the wages paid in the several industries. In com-

puting this weighted average the relative number or index for a year for each industry was multiplied by the wages paid in each industry, respectively, as shown by the U. S. census of 1900, expressed in the nearest \$100,000. The products were then added and the sum divided by the total wages paid in the industries represented.

The following table shows the relative weight accorded to each industry:

| INDUSTRY | Weight |

| 1906..... | 142.9 | 95.4 | 124.2 | 118.5 | 115.7 | 107.3 |

The foregoing table shows for the years 1890 to 1906 the relative wages per hour, the relative hours of labor per week, the relative number of employees covered by the report in the establishments investigated, the relative retail prices of food, and the relative full-time weekly earnings per employee and relative purchasing power of hourly wages and of full-time weekly earnings per employee as measured by retail prices of food.

The relative numbers shown are percentages, the base (100.0) being the average for the ten years 1890 to 1899.

AGRICULTURAL WAGES

Farm Laborers

B. OTHER COUNTRIES

Various Estimates

Perhaps the most recent book which at all adequately discusses the question of wages from an international standpoint is Dr. Arthur Shadwell's "Industrial Efficiency," a comparative study of industrial life in England, Germany, and America (1906). He comes to the conclusion that (vol. ii., chap. viii.) so-called "average wages" reached by averaging skilled and unskilled wages in varying degrees are so misleading that "the wage of the unskilled laborer who occupies the same position in every country" is the safest basis for international comparison, and finds the following facts:

DAILY WAGE OF UNSKILLED DAY LABOR. Winter, 1902-3 (in industrial centers)

| | Actual | Average | Per cent |
|--------------------|-------------|---------|----------|
| England..... | \$0.75-1.00 | \$0.87 | 100.0 |
| Germany..... | .62-.75 | .68 | 78.6 |
| United States..... | .75-1.75 | 1.25 | 142.8 |

WAGES AND HOURS OF LABOR IN LEADING OCCUPATIONS IN THE UNITED STATES AND IN EUROPE, 1890 AND 1903

¹ No data obtained.

The wages and hours of labor shown for the United States are for blacksmiths in the foundry and machine-shop industry.

The wages and hours of labor shown for the U. S. are for carpenters in the building industry.

The wages and hours of labor shown for the U. S. are for compositors, newspaper.

The wages and hours of labor shown for the U. S. are for iron-molders in the foundry and machine-shop industry.

The wages and hours of labor shown for the U. S. are for laborers in the building industry.

The wages and hours of labor shown for the U. S. are for machinists in the foundry and machine-shop industry.

He finds this general proportion approximated in several skilled trades, for instance, in the metal trades, and concludes that in general German wages are about four fifths and American wages seven fifths of English wages, tho (see EXPENDITURES) he thinks that for skilled labor (not in general) the higher cost of living in the U. S. makes up for the higher wages as compared with England, tho not as compared with Germany. German wages, however, he considers to be somewhat rapidly on the increase.

III. ARE REAL WAGE CONDITIONS IMPROVING?

This is one of the most difficult questions to settle and is very variously answered by different authorities according to the point of view:

A. THE FAVORABLE VIEW

Most conservative writers maintain that, however poor the condition of the wage-worker is to-day, he is at least far better off than ever before in the world's history. Mr. John Rae adduces evidence in his "Contemporary Socialism" (1st ed., p. 390) "to show how greatly improved the working-class standard of living now is from what it was 200 years ago in the good old times Socialist writers like to sing of." He says:

If poverty were increasing with the increase of wealth, it would show itself either in an increase of pauperism or in a decline in the general standard of living among the laboring classes or in a fall in the average duration of life, and these symptoms would be most acute in the countries that are the most wealthy and progressive. To prove that these symptoms of increasing poverty do not exist, he quotes Sir M. Hale and Gregory King, writers of the seventeenth century, to show that in their day one out of every ten, or, including

children, one out of every six, received alms. To-day Mr. Rae says it is only one out of thirty. Wages at that time could not support the laborer. Everything was higher then except butcher meat, but half the population had meat only twice a week, and a fourth only once. The laborer lived chiefly on bread and beer, and bread was as dear as now. Fuel, light, and clothing were all much dearer.

For the United States, Carroll D. Wright similarly argues the improved condition of the wage worker. In his "The Industrial Evolution in the United States," and in his article "Wages" in "Johnson's Cyclopaedia," he sums up the wage history of the U. S. substantially as follows:

In 1633 the Massachusetts Bay Colony, by the action of the general court, made it a rule that carpenters, sawyers, masons, bricklayers, tilers, joiners, wheelwrights, mowers, and other master workmen should not receive more than 25. a day, the workman to pay his own board; but should he elect to board with his employer, then he was to receive 12d. a day. The rates of inferior workmen were to be fixed by the constable. Skilled tailors were to be paid 12d. a day, poorer ones 8d. At the close of the seventeenth century common laborers were paid 25. a day, as they had been forty years before. At the close of the colonial period laborers on farms were paid 40 cents a day; butchers, 33½; carpenters, 52; ship and boat

Colonial Period.

builders; about 90; shoemakers, 73; blacksmiths, 70. Prices were uneven; there was no common market. Wheat might bring at one place 55. at another 105; \$1. Mr. Wright thinks could then buy one bushel of winter wheat, one gallon of common molasses, a bushel of barley or of rye, one and a third bushels of corn. A common grade of wheat flour was \$1.6 per barrel. Butter, cheese, and meats were cheaper than now. Sugar, tea, and coffee were dearer than now. Common necessities were cheap.

After the colonial period wages slowly rose. Laborers received in 1790, 43 cents a day; in 1800, 62½ cents; from 1800 to 1810, 82 cents per day; from 1810 to 1820, 90 cents; from 1820 to 1830, from 87½ cents to \$1. Carpenters in 1790 were paid less than 60 cents per day; in 1800, over 70 cents; in 1810, \$1.09; in 1820, \$1.13; from 1830 to 1840, \$1.40 in the northern states. Cotton-mill operatives received until 1830, 44 cents per day;

just prior to 1840, 90 cents, and from 1840 to 1850, \$1.03 per day. Woolen-mill operatives were paid higher prior to 1830, being paid \$1.12. In 1840 carpenters were paid \$1.50 per day in New York, and in 1891, \$3.50. Bricklayers and their helpers received \$1.75 and \$1 respectively in 1851, and \$4 and \$2.50 in 1891. Locomotive engineers and firemen received \$2.14 and \$1 in 1840, and \$3.77 and \$1.96 in 1891, these figures being taken from actual pay-rolls. The great crises of 1837 and 1857 depressed wage-rates, which did not recover before 1860. Comparing wages in 1860 and 1880, Mr. Wright uses the above-referred-to Aldrich Senate Report, calling it "a most excellent one, and indicates the general course of wages better than any other statement yet made."

Early Part of this Century According to this, he says: "Wages stood at 87.7 per cent in 1840 as compared with 100 per cent in 1860; in 1866 they stood at 152.4 per cent and in 1891 at 160.7." "To be more correct, however," says Mr. Wright, "the rates should be taken in accordance with the importance of each industry relative to all industries. . . . On the latter basis wages have increased 68.6 per cent since 1860 and 86.1 per cent since 1840. . . . It is fair to say that wages in the leading industries of the country are 80 per cent at least higher than they were in 1840. Very many wages are double what they were at that date."

Of prices Mr. Wright says: "With this increase there has been in every direction a decrease in the working-time of each day, and a general decrease in the cost of living, taking all articles into consideration. The decrease in the cost of living, however, has not been equal to the increase in wages. Rents are much higher, and so are meats and some other articles; but taking the wholesale prices of 223 of the leading articles of consumption, it is found that there has been a decrease since 1860 of about 6 per cent."

Present

B. THE UNFAVORABLE VIEW

The belief that American wages have steadily risen is largely based on the Aldrich Senate Report of 1893. Now, this report is believed by many scholars to be utterly unreliable. Dr. Spahr, in his "Present Distribution of Wealth in the United States," argues the utter worthlessness of its conclusions, and says (p. 103):

The statisticians employed to summarize the returns were to a hurtful extent in sympathy with the political aim of the investigation. This criticism in no degree applies to Mr. Joseph D. Weeks, whose work is in the highest degree conscientious and intelligent. But Mr. Weeks's conclusions are not embodied in the committee's comprehensive summary for "all" occupations. It is this summary that has spread so much misinformation throughout the country. Some of the more serious errors in the report are apparent upon a casual examination. When any one at all familiar with the course of wages in recent years takes up the report, he is astonished to see that the wages of clerks in stores have risen out of all proportion to wages in other industries. In the metal works, as he would expect, currency wages are reported to have

A False Report

fallen since 1873; so, too, in the cotton factories; but in stores, where the invasion of women and girls is believed to have depressed wages to an unusual extent, he finds it reported that an advance of nearly 40 per cent has taken place. If, to understand the anomaly, he takes the trouble to consult the original data, he discovers that for the metal works and cotton factories the returns covered many establishments and many hundreds of employees, while for stores the returns covered but one dry-goods store and one grocery, employing together less than thirty clerks. Yet the committee, in its table of "simple averages for all industries," made the uninvestigated industry count as much as either of the thoroughly investigated ones. And the committee did not stop here. Despite this assumed rise of nearly 40 per cent in the wages of clerks, the table of "simple averages" still showed that currency wages had fallen 4 per cent since 1873. Thereupon the committee proceeded to make a table of "weighted averages," assuming that the incredible advance of 40 per cent in wages had been received by all the clerks in the country, and that since these outnumbered the employees in metal works and cotton-mills put together, therefore the returns for less than thirty clerks ought to outweigh those for more than 1,500 metal workers and more than 3,000 cotton operatives. By this means currency wages in 1891 were made to rise 1 per cent above the level in 1873.

To cut short the criticism, in order to get at the facts reported, it is necessary to throw away the work done by the committee's experts, and return to the original reports made by the employers.

Accepting the returns of the report itself, Dr. Spahr shows that real wages, instead of rising

since 1873, fell materially down to 1891, and in 1894 were 20 per cent lower than in 1891. The only industries in which wages rose between 1873 and 1891, according to the returns gathered by the report, were in the manufacture of ale, beer, and porter; the making of carriages and wagons; in the case of the clerks of the two dry-goods and grocery stores mentioned above; in the making of paper, of spice, and of woollens. In the report itself the facts showing the fall of wages in the cotton and metal industries alone cover 686 pages, while the facts which the experts have magnified to overbalance the fall in wages cover only eleven pages.

Again, admitting that wages are higher to-day than early in the nineteenth century, which no informed scholar denies, it does not follow that the laborer's real economic status is improved. Early in the century, life was simple, wages were low, hours were long. But the workman who was faithful had a practical security of work. He often lived in a little home of his own whose garden could supplement his low wage. To-day his wage is all, and he has no security of work. The problem of the unemployed is the pressing problem of the present situation. If hours were long early in the century, the worker working at his little cobbler's bench or in a little shop, where some one could read aloud, had much more real opportunity to develop his own individuality than to-day, tho working at shorter hours, in crowded factories amid machinery driven at its utmost speed. Real freedom and economic status, more than wages, therefore, must be taken into consideration before we can admit advance. As for comparison with a remoter past, Mr. Rae, as quoted above, argues that the workman is vastly better off to-day than "200 years ago, in the good old times Socialist writers like to sing of"; but no Socialist writer sings of 200 years ago. By exactly picking his dates, Mr. Rae seems to prove progress for the working classes. Hale and King, whom Mr. Rae quotes, wrote in the last part of the seventeenth century. Two hundred years before that and fifty years after that Mr. Rae would have found a very different state of things. In the fifteenth century, before the English laborer had been driven off from the land, and was still under a form of feudal tenure, and yet no longer a serf, he was in what Mr. J. E. Thorold Rogers has called the "golden age of England." In the first part of the eighteenth century, when there was a revival of handicraft and machinery was not developed and monopolized, wages were higher than they were either immediately before or immediately after. It is to these times rather than to the seventeenth century that Socialist writers are apt to revert. And for the view that compared with these periods the present condition of the wage-earner is not so favorable, they have good authority.

As for Great Britain, comparing conditions in 1837 and 1897, Sydney Webb says in "Labor in the Longest Reign":

If we might sum up in one general impression the different facts as to comparative wages, we should, I think, have to come to this conclusion: While the skilled male craftsman has largely increased his income, and a practically new class of responsible and fairly well-paid laborers and machine-minders has come into existence, there exists now a greater sum, tho a smaller proportion of hopeless destitution than at any previous time. It appears, at any rate, highly probable that in 1897 there are positively more people in Great Britain who are existing at or near starvation wages than there were in 1837, altho their number bears a small proportion to the whole.

Mr. Charles Booth tells us, in the effective "eloquence unadorned" of his columns of statistics, that some 32 per cent of the whole four millions of London's population fall within his four classes of "poverty," earning not more than a guinea per week per family. It is difficult to believe that, even in 1837, the percentage of persons at a corresponding low level can have been greater. It is practically certain, remembering the great increase in the total population, that at no previous time were the actual numbers more than at present. It has been reserved for our own prosperous time to produce the spectacle of over a million of people within one city living "in poverty." And when we examine closer into Mr. Booth's appalling details, and begin to realize that out of this huge residuum nearly a third are actually below what can be called even full subsistence for a London family, we shall begin to feel that our boasted progress since 1837 has not, after all, taken us very far. The 300,000 Londoners who fail to get even 18s. a week per family, and live in "chronic want," can never have been poorer. Their actual number in the much smaller city of 1837 cannot have been so great. And if we take into account the shums of our other great cities, and realize that we have in our midst a class of at least a million persons, besides the million at any one time in receipt of poor-law relief, who live in "chronic want" of even the necessities of life, we shall begin to understand how very partial, after all, has been our progress.

It is often assumed that this huge residuum which is existing in our midst at starvation wages is made up entirely of unskilled laborers, women plying the needle, and drunkards and wastrels of all kinds. But this is not the case. The unskilled laborer, indeed, is morally entitled to full subsistence, tho he does not always get it; but even men with a trade are sometimes little better off. We find to-day numerous small classes of skilled craftsmen in large towns whose weekly earnings do not amount to a pound a week.

Professor Rogers is not blindfold to the conditions of the past, yet in a carefully balanced paragraph he says ("Six Centuries of Work and Wages," chap. vi.):

The life of our ancestors, tho laborious, was not without its hopes. All the necessities of life in ordinary years, when there was no dearth, were abundant and cheap, and even in dear years the margin of wages or profits over the bare wants of life was considerable enough to fill up the void, even tho the laborer had to subsist for a time on some cheaper food than wheaten bread. Meat was plentiful; poultry found everywhere; eggs cheapest of all. The poorest and meanest man had no absolute and insurmountable impediment put on his career, if he would seize his opportunity and make use of it. I am alive to the fact that in many particulars he was far behind his descendants in the conveniences and comforts of life.

I am alive to the fact that what were once the luxuries of the very few have now become the habitual comforts of the many, and that enterprise has scoured the earth to make these and newer luxuries abundant and cheap. I know that owing to the spread of knowledge, the adaptation of industry, the energy of invention, and the

Progress extension of trade, the population of England and Wales is tenfold what it was six centuries ago; that trim gardens, magnificent mansions, noble parks, rows of banks and houses, vast and splendid cities, occupy sites which were covered by squalid hovels or frequented by wild boars, curlews, and bitterns, or were marsh fens and wild moors. I can see, without being reminded, that the most lofty and subtle pleasures of literature are now common and profuse, and that the world of civilization is so strong that there seems no possible danger of its becoming destroyed by a new incursion of barbarians, not even of those barbarians whom it creates.

. . . I do not need to be told that the wealth of London is such that a single block of buildings pays a higher rent to its fortunate owner than was derived from the whole customs of the port in the days of the Plantagenets and Tudors, that in a few hours a loan could be raised in London sufficient to equip and provision an army more numerous than all the men at arms were in medieval Europe, and this probably without deranging the course of trade or materially interfering with the functions of credit. And I suspect that when we are invited to consider all these things and more of the same nature, as the prodigious strength of modern governments, the boundless resources of modern societies, the priceless collections of art and letters, the ceaseless activities of enterprise and the ever-increasing discrepancies of science, it is fancied that a complete answer is given to those who entertain misgivings because they believe there is a reverse to the picture, another side to the shield, which these triumphant eulogies on modern progress would have us conceal or forget. . . . It may be that the progress of some has been more than counterbalanced by the distresses and sorrows of many, that the opulence and strength of modern times mock the poverty and misery which are bound up with and surround them. . . . It may be well the case, and there is every reason to fear it is

Reverse Picture

the opulence and strength of modern times mock the poverty and misery which are bound up with and surround them. . . . It may be well the case, and there is every reason to fear it is

the case, that there is collected a population in our great towns which equals in amount the whole of those who lived in England and Wales six centuries ago, but whose condition is more destitute, whose homes are more squalid, whose means are more uncertain, whose prospects are more hopeless than those of the poorest sorts of the Middle Ages and the meanest drudges of the medieval cities.

In another passage (*idem*, chap. xix.) he thus sums up the economic history of the English laborer in the following words:

I have shown that from the earliest recorded annals, through nearly three centuries, the condition of the English laborer was that of plenty and hope; that from perfectly intelligible cause it sunk within a century to so low a level as to make the workman practically helpless, and that the lowest point was reached just about the outbreak of the great war between king and Parliament. From this time it gradually improved, till in the first half of the eighteenth century, tho still far below the level of the fifteenth, it achieved comparative plenty. Then it began to sink again, and the workman experienced the direst misery during the great continental war. Latterly, almost within our own memory and knowledge, it has experienced a slow and partial improvement.

Some still more pointed passages from Mr. Rogers's work are as follows:

I am convinced that at no period of English history for which authentic records exist was the condition of manual labor worse than it was in the forty years from 1782 to 1821, the period in which manufacturers and merchants accumulated fortune rapidly, and in which the rent of agricultural labor was doubled (chap. ii.). I have stated more than once that the fifteenth century and the first quarter of the sixteenth were the golden age of the English laborer, if we are to interpret the wages which he earned by the cost of the necessities of life (chap. xii.). I contend that from 1563 to 1821

Conspiracy a conspiracy concocted by the law, and carried out by parties interested in its success, was entered into to cheat the English workman of his wages, to tie him to the soil, to deprive him of hope, and to degrade him into irremediable poverty (chap. xiv.). We have been able to trace the process by which the condition of English labor had been continuously deteriorated by the acts of government.

It was first impoverished by the issue of base money. Next it was robbed of its gild capital by the land thieves of Edward's regency. It was next brought in contact with a new and more needy set of employers, the sheep masters, who succeeded the monks. It was then with a pretense, and perhaps with the intention of kindness, subjected to the quarter sessions amendment, mercilessly used in the first half of the seventeenth century, the agricultural laborer being still further impoverished by being made the residuum of all labor. The agricultural laborer was then further mulcted by inclosures, and the extinction of those memorial rights of pasture and fuel which he had enjoyed so long. The poor-law professed to find him work, but was so administered that the reduction of his wages to a bare subsistence became an easy process and an economical expedient (chap. xvii.). Some of the working classes in London, and those who have been long educated in the machinery of labor partnership, have at last regained the relative rate of wages which they earned in the fifteenth century, tho perhaps in some particulars the recovery is not complete (chap. xix.). I make no doubt the ordinary hardships of human life in England were greater and, I am sure, they were more general six centuries ago than they are now. Life was briefer, old age came earlier, disease was more deadly, the risks of existence were more numerous. But the extremes of wealth and poverty were by the fact of these common conditions less widely separated. Above all things, what is now characteristic of human life, that one half of the world does not know how the other half lives, a very moderate statement of the fact, was not true of the early ages of English progress. . . . The grinding, hopeless poverty under which existence may be just continued, but when nothing is won beyond bare existence, did not, I am convinced, characterize or even belong to medieval life.

Grinding Poverty

extremes of wealth and poverty were by the fact of these common conditions less widely separated. Above all things, what is now characteristic of human life, that one half of the world does not know how the other half lives, a very moderate statement of the fact, was not true of the early ages of English progress. . . . The grinding, hopeless poverty under which existence may be just continued, but when nothing is won beyond bare existence, did not, I am convinced, characterize or even belong to medieval life.

Says Mr. Frederick Harrison:

To me, at least, it would be enough to condemn modern society as hardly an advance on slavery or serfdom, if the permanent condition of industry were to be that which we behold, that ninety per cent of the actual producers of wealth have no home that they can call their own beyond the end of the week; have no bit of soil, or of so much as a room that belongs to them; have nothing of value of any kind except as much old furniture as will go in a cart; have the precarious chance of weekly wages which barely suffice to keep them in health; are housed for the most part in

places that no man thinks fit for his horse; are separated by so narrow a margin from destitution, that a month of bad trade, sickness, or unexpected loss brings them face to face with hunger and pauperism. . . . This is the normal state of the average workman in town or country. (Mr. Frederick Harrison, p. 429, "Report of Industrial Remuneration Conference," 1886.)

Nevertheless, the progress in many ways must not be overlooked.

H. N. Casson says of the U. S.: "The average laborer 100 years ago had fewer comforts and less consideration than a horse or dog has to-day. The laborer lived in a house of unpainted boards; he had sand on the floor instead of carpet, and his dishes were made of pewter instead of china. If he had fresh meat once a week he thought himself lucky. A good share of his wages was paid in rum and gin; then, when he got drunk, his employer had him arrested. Worst of all, it has been clearly proved that in some factories women and children were thrashed with a cowhide if the overseer caught them snatching a moment's rest."

As to progress in recent years the question is, if anything, still more difficult to answer in any general way. Undoubtedly statistics, so far as they go, show in most countries for the main industries some advance measured by the cost of living, tho no large advance, except for a few highly organized trades. But the question still remains whether such statistics are reliable. As shown in Section II. of this article such statistics are and must be usually based on returns from the larger establishments and the better organized industries. It therefore seems fair to say that they are not representative. Whether, therefore, in general real wages for the working classes have risen or not, measured by prices, is not proven and various minds will answer the question in various ways. General averages as to wages are almost worthless. If in a factory there are eighty men earning each only \$1 a day and twenty especially skilled workers earning each \$6 a day, the average in that factory would be \$2 a day, and yet a mere statement of the average would utterly conceal the true facts. In America in almost every trade a few workmen receive very high wages, and so American averages of wages conceal the real wages, often very low, paid to a large share of our workers. Again the worth of wages depends on the cost of living. It is generally thought that wages of late years have risen; yet the report of the Bureau of Labor Statistics in the prosperous State of New York says, for the year ending Sept. 30, 1901: "It therefore seems safe to say that, despite the more regular employment and higher wages now enjoyed by the working people, their economic condition is little better than it was four years ago, save that they now work shorter hours." Again, income depends not only on the amount a man receives per day, but the number of days in a year he has work. Yet this simple fact is continually forgotten in comparing wages in different countries and trades. One dollar a day all the year round is better than \$4 a day once a week. Once more statements as to wages are continually vitiated by the bias of opinion of those who interpret or collect the data upon which they are based. Reformers often estimate wages lower than they are, to show the need of reform. Conservatives and supporters of whatever political administration is in power, and this unfortunately includes almost all official statisticians, are tempted to statements as roseate as possible. The belief that American

wages have steadily risen in recent years has been till recently largely based on the Aldrich Senate Report of 1893. Yet this report is believed by most scholars to be utterly unreliable. Dr. Spahr, in his "Present Distribution of Wealth in the U. S.," argues the utter worthlessness of its conclusions to-day. Accepting the returns of the report itself, Dr. Spahr shows that real wages, instead of rising since 1873, fell materially down to 1891, and in 1894 were twenty per cent lower than in 1891.

On the other hand, most statisticians, as we have said, do figure out a small rise of wages. For the U. S. the following table is among the best:

RELATIVE MOVEMENTS OF WAGES AND WHOLESALE PRICES

| YEAR | Wholesale prices ¹ | City wages (in gold) ² occupations ² | Wages 192 occupations ² | Wages of farm laborers (gold) per month without board ⁴ |

¹ Bureau of Economic Research.

² Bulletin, Sept., 1898.

³ Bulletin, July, 1900.

⁴ Department of Agriculture, No. 22, Miscellaneous Series, 1901.

For years 1901-1906 see p. 1266.

Concerning recent rise or fall of wages in Great Britain the annual report of the (English) Labor Department on "Changes in Rates of Wages and Hours of Labor in the Kingdom" (1905) summarizes the principal data contained in the returns for the ten-year period, 1896 to 1905. Since the number of agricultural laborers, seamen, and railway employees affected by these changes is not known, they are not included in the general tables, but are treated separately in the report.

The table covers a period of five consecutive years of increasing wages, followed by five consecutive years of decreasing wages. A comparison of the net results of these two periods shows that the total increase exceeds the total decrease by £208,734 11s. (\$1,015,806). The wage loss for the year 1905, calculated from the date on

which the various changes became operative, amounts to £114,000 (\$554,781), or an average loss for each person affected by reduction of wages of 9s. 2d. (\$2.22).

The table below shows for each year, by industries, the number of persons affected by changes in rates of wages, and the net amount of weekly increase or decrease as compared with the previous year for each year, 1902 to 1905.

There was somewhat of a decline in wages paid agricultural laborers in England and Wales and in Scotland, while in Ireland reports showed very little change in the wages paid this class of labor.

Wages of seamen engaged on steamships, as compared with 1904, showed a slight decrease. Wages on sailing vessels showed no change. The average wages paid able seamen on steamships in 1905 were 80s. 5d. (\$19.57) per month, as compared with 80s. 6d. (\$19.59) in 1904. Firemen and trimmers were paid 85s. 2d. (\$20.72) per month in 1904, and 85s. 1d. (\$20.70) in 1905. The men receive food in addition to the wages named.

Concerning agricultural wages, according to a report on "Wages, Earnings, and Conditions of Employment of Agricultural Laborers in the

United Kingdom" (Labor Department, 1905), the following table gives the facts:

[The averages here shown relate to able-bodied male adults. They do not include the earnings of stewards, bailiffs, foremen, or casual laborers. All computations are based on the census returns for 1901.]

| COUNTRY | ORDINARY AGRICULTURAL LABORERS | | | | All classes of agricultural laborers, including ordinary laborers and men in charge of animals, 1902 |
|-------------|--------------------------------|----------|---|----------|--|
| | 1898 | 1902 | Increase in 1902, as compared with 1898 | | |
| | | | Amount | Per cent | |
| England . | \$4.0757 | \$4.2379 | \$0.1622 | 3.98 | \$4.4407 |
| Wales . . . | 4.0149 | 4.2784 | .2635 | 6.56 | 4.1973 |
| Scotland . | 4.4205 | 4.7246 | .3041 | 6.88 | 4.6840 |
| Ireland . . | 2.4739 | 2.6158 | .1419 | 5.74 | 2.6563 |

According to the figures shown in the report, the average value of the food consumed weekly by a farm laborer, his wife, and four children is 13s. 6½d. (\$3.30) in England, 15s. 2½d. (\$3.70) in Scotland, and 10s. 5¼d. (\$2.55) in Ireland.

NUMBER OF PERSONS AFFECTED BY CHANGES IN RATES OF WAGES, AND NET AMOUNT OF INCREASE (+) OR DECREASE (—) IN WEEKLY WAGES, 1902 TO 1905

² Decrease.

WAGES OF SUPERINTENDENCE: It is often forgotten that the employers of labor usually, tho not always, do important work themselves. They furnish to an industry the most important work of superintendence, of planning the work, of obtaining the raw material, of providing the plant and machinery—in a word, of managing the business. This work is almost always of the extreme importance. Especially under sharp competition, management is sometimes nine tenths of the element of success. It demands usually large and varied talents, concentration of thought, attention to small details, and yet ability to run the business as a whole. It demands long hours and continuous responsibility. The employee who works even long hours, when his hours are over is free. The employer is often never free. He sometimes works all day and worries all night. His work, therefore, is often long and exacting, as well as of the utmost importance. He is, as such, a skilled wage-worker, and what he earns as such (not as a mere capitalist, but as performing the work of superintendence) is money earned by hard labor, and may be, as it is often, called the wages of superintendence. It is often high wages, but even so is often wholly earned. Socialists do not object to wages of superintendence. They recognize the importance of superintendence and its value in production, only they would have it performed for the community and not for private stockholders. The very same men, they say, who do such work to-day for private firms could do it under socialism for the people, as, indeed, does occur when a railroad goes into the hands of a receiver.

WAGNER, ADOLF HENRI GOTTHILF: Political economist; born at Erlangen in 1835. Studying at the University of Heidelberg, he became in 1858 professor in the Commercial College of Vienna, and then at Hamburg, Dorpat, Freiburg, and since 1870 at Berlin. He is prominent as a leader in the historical school of Germany, and particularly as a Socialist of the Chair (q. v.), and a sympathizer with German Christian socialism (q. v.). He is best known for his studies in finance and his general economic treatise. Among his works are "Die Geld und Kredit theorie der Peelschen Bankacte" (1862); "System der deutschen Zettelbank-Gesetzgebung" (1873); "Lehrbuch der politischen Oekonomie" (1872).

WALD, LILLIAN D.: Founder and head of Henry Street Settlement; born Cincinnati, Ohio, 1866; educated in private schools, New York Hospital Training School, special courses in Women's Medical College, etc. Established system of non-sectarian nursing in conjunction with social settlements, on a district plan which covers the whole of Manhattan and the Bronx; originated for New York public-school nurse system under municipal pay and control; has taken active part in State and National Child Labor Committee work. She has been identified with trade-union movement and on the National Board of Women's Trade-Union League since its establishment. Miss Wald is identified with many of the movements for social and educational equalization; has been an occasional contributor to *Charities and the Commons*, *The Annals of the American Academy of Political and Social Science*, and the *American Journal of Nursing*. Address: 265 Henry Street, New York City.

WALDSCHMIDT, JOHANN: Editor of *Alkoholismus*; born 1854 at Dortmund, Germany. After completing his medical studies was for some time assistant physician in a public asylum. Devoted several years to the comparative study of brain anatomy. Thereupon established a private asylum for the treatment of the insane in which he held for nine years the position of director. Since 1899 has been member of the municipal government of Charlottenburg, and is at the present time chairman of the Municipal Health Committee, founded in 1900 for the Berlin District Association against the abuse of alcoholic beverages, the Walfrieden sanitariums near Furstenwalde on the Spree; Administration Council appointed Dr. Waldschmidt their representative with special charge of the inspectorate of the sanitariums. Established in the same year the magazine *Der Alkoholismus*; member of board of directors of German Association Against Abuse of Intoxicating Liquors; member for German lands of the Federation of Sanitariums for Cure of Drunkenness. Author: "Duties Toward Drunkards," "Alcohol and Accidents," "Medical Assistance to Drunkards," "The Care of Drunkards in Prussia," etc., etc. Address: Nikolassee, near Berlin, Germany.

WALKER, AMASA: Political economist; born Woodstock, Conn., in 1799. Educated in public schools, he became a merchant in Boston in 1825, and gained prominence in the construction of the early railroads, and also in the antislavery and temperance reforms. Professor of political economy in Oberlin College, Oberlin, Ohio, 1842-49; in the Massachusetts Legislature, as a member of the House in 1848, and of the Senate in 1849; Secretary of State, 1851-52. In Congress 1862-63, and lecturer on political economy at Amherst College, 1861-66. Died at North Brookfield in 1875. Author: "The Science of Wealth," and other works.

WALKER, FRANCIS AMASA: Political economist; born Boston, 1840, the son of Amasa Walker (q. v.). Graduated at Amherst College in 1860, studied law at Worcester, but entered the army in 1861 as sergeant-major. Steadily promoted, he became brevet brigadier-general in 1865. Wounded at Chancellorsville, he was captured at Ream's Station, and confined at Libby Prison, where his health became shattered. After the war he was teacher at Williston Seminary, 1865-68; editor of the *Springfield Republican*, 1868-69; chief of the Bureau of Statistics of the Treasury Department at Washington, 1869; superintendent of the ninth United States census, 1870; Commissioner of Indian Affairs, 1871-72; professor of political economy and history in the Sheffield Scientific School of Yale College, 1872; superintendent of the tenth U. S. census, 1880; and president of the Massachusetts Institute of Technology in Boston, 1881, which position he held till his death in 1897. He is best known in economics as the main originator of the theory that wages depend upon production, for his Ricardian views of rent, and his advocacy of international bimetalism. He is considered by many, such as Dr. Ingram, as among the ablest of American economists. Author: "The Wages Question"; "Money"; "Political Economy"; "Land and Its Rent"; "The Making of a Nation"; "International Bimetalism."

WALKING DELEGATE, THE, is the paid secretary of a trade-union. His duties usually are to pay out the sick and out-of-work benefits of the union; to see that they are only paid to those really entitled to them; to visit the sick members; to care for the burial of members who have died; to try and secure work for members out of work (thus often having an office and acting as an employment bureau); to investigate troubles between members and employers; to try and secure redress from the employers if the case is found to need it; to report to the union if the employers will not grant redress—to advise the union whether or not it is advisable to strike; if the union votes to strike, to give the signal to the members when to strike and to take charge of the strike.

It is this last duty which has made the name of the walking delegate so unpopular with employers. They see him give the signal to strike; at his signal they see their men lay down their work; the walking delegate visits the employer to represent the men; the employer not unnaturally thinks that the walking delegate, who appears to be, and often is, the leader of the union, is the person who has stirred up the evil, and that at his order his men have struck. He therefore thinks that his men are under the tyranny or at least the influence of this "paid agitator," and lays at his door most of the evil of the strike.

As a matter of fact, in no trade-union is a walking delegate ever allowed to order a strike. He is always the servant of the union, usually poorly paid, and can only give a signal when the union has voted to strike—never an order. English and American trade-unionists are singularly democratic and jealous of authority. They never put themselves under a walking delegate.

Employers too often resent dealing with their men through a walking delegate; they say that they wish to deal with their men directly. They forget that any body of men has unquestioned right to deal through a representative. Corporations continually do so. Trade-unions do so because they have learned that an employee dependent upon an employer cannot face the employer as can a walking delegate who is independent of the employer. Hence the need in justice of employing a walking delegate to conduct such negotiations. Thomas S. Adams, in his "Labor Problems" (pp. 192-193), strongly dissents from "the doctrine that when a walking delegate or a union organizer goes into a factory or mine, and persuades the employees to strike, he is necessarily without real interest, and guilty of malicious interference. Doubtless there are cases in which the object of the walking delegate is simple blackmail. But in the great majority of instances his work is perfectly legitimate." The walking delegate's main duty, however, is to care for the sick and out-of-work. Strikes come but rarely; the sick and needy are always present.

Dr. Rainsford, of New York City, said some years ago concerning walking delegates:

I believe the labor leaders in the United States, taking them all in all, are just as good as the leaders in law or finance or society or politics. . . . I know a man who for years in this country has occupied one of the first positions as a labor leader. No word is too bad to be said about him by most of the press, and some of the colleges; and I know, as a matter of fact, that the man, with a large family of children, never drew but one half his salary during the whole time he held office, and put the other half back into the treasury of his organization. I know a man who, if my judgment amounts to anything, is one of the ablest men in the U. S.—a man who has great powers of tongue and great powers of organization, and a true, whole-souled man, and altho, alas! he is outside the Christian

Church, I venture to say, a large, whole-souled Christian, too. That man is at the head of an enormous federation in this country, and has never taken but \$2.50 a day, which is due to him from his trade, and he has never taken, even his \$2.50 a day except when he was engaged in the active business of his federation; and when he has not been engaged in their business he has worked at his trade like anybody else. And I will tell you that this winter, with an old mother to support, that man walked the streets in the cold for three long weeks to get work (and there is no better workman at his trade), because boss after boss said, "Mr. So-and-so, you are upholding labor-unionism, and we won't give you work." That man walked for three weeks before he could get a job for \$2.50 a day, rather than give in and surrender his principles. I say that if our Lord and King were back on the earth, I believe from my soul that those men would be in His train.

Of recent years, it is true, the growing powers of the unions in certain trades has exposed the walking delegate, or "business agent" as he is now commonly called, to certain great temptations to which he has not always been superior. A man who has the power or influence to call or call off, to create or prevent a strike, involving thousands and thousands of men, and also thousands and hundreds of thousands of dollars, can, if he will, traffic in that power. Those that know the trade-unions best are agreed that such "trade-union graft" is the exception, yet that it does exist and in the great cities in certain trades (see BUILDING TRADES) is not uncommon. In cases it has assumed colossal size and has done widespread harm to capital and labor. A notorious case is that of Samuel Parks (*q. v.*) in New York. Of this case, however, it should be said that it was exceptional and that it is an open question who was most to blame for his career, the employers or certain unions who blindly supported him because of his personal popularity even after his conviction. An article in *McClure's Magazine* for August, 1902, entitled "The Labor Boss," named a certain construction company which had made use of Parks in Chicago and brought him to New York under their pay. Certain it is, the article says, that strikes on their buildings were almost unknown, while the buildings of rival companies were continually delayed by strikes. The suggestion is made in the article that Parks was brought to New York to corrupt the building unions, in which he succeeded only too well. Whatever be the truth—and this article gives names and dates—it shows how intricate are the questions involved and how difficult the placing of the responsibility. That business delegates have abused their power is certain, but that as a class they are dishonest is certainly not the case, nor should organizations be blamed indiscriminately for the misdoings of occasional agents. The graft in trades-unions is certainly both in quantity and quality less than in most great capitalistic organizations.

WALLACE, ALFRED RUSSEL, D.C.L.: Scientist and Socialist; born 1823, Usk, Monmouthshire, England; educated at the grammar school, Hertford. From age of fourteen to twenty-one, with elder brother, was learning land surveying and architecture in various parts of England and Wales; was for two years English and drawing master at the Collegiate School, Leicester. Then spent two years surveying, etc., at Neath, Glamorganshire. Went in 1848 to the Amazon on a natural-history collecting expedition. In 1852, after shipwreck by fire in mid-Atlantic, returned home and spent the next two years in writing the story of his findings and adventures. Traveled, 1854-62, in Malay Archipelago from Malacca and Borneo to New Guinea, bringing home a large collection of birds, insects, etc. Has spent

the many years since in profound scientific and philosophic research, and in writing numerous books—of inestimable service to mankind. In 1890 became a Socialist. Dr. Wallace's socialism is founded on fundamental ideas of social justice. The methods he proposes are absolute "equality of opportunity" for every child born into the world; as this necessarily implies equality (not identity) of education, nurture, and a thorough equipment for an industrial life, the community must be the holder of all its land and capital. The method of transition he advocates is the resumption of all land and capital at the deaths of existing owners, their direct heirs to be adequately provided for. This he conceives to be the line of least resistance and not to involve any infraction of the fundamental principles of equity. Author: "Travels on the Amazon and Rio Negro," "The Malay Archipelago," "Land Nationalization," "The Wonderful Century," "Man's Place in the Universe," "Essays, Scientific and Social," "My Life: a Record of Events and Opinions," "Is Mars Habitable?" and many works on natural history. Address: Broadstone, Wimborne, England.

WALLACE, JOHN BRUCE: Born in India in 1853, his father being a missionary there of the Presbyterian Church. Educated in Europe and at Queen's University, Ireland, he entered the Congregational ministry in 1878. In 1885, however, he renounced the regular ministry to devote himself to Christian socialism, and in 1887 began to publish a paper, *Brotherhood*, in Ireland. In 1891 he settled in London, and published *Brotherhood* there. In 1892 he became pastor of the Southgate Road Church ("The Brotherhood Church"), and has since been active in various brotherhood movements. Address: Letchworth, Herts, England.

WALLAS, GRAHAM: Publicist, and member of the London County Council; born at Sunderland, May 31, 1858. The son of a clergyman, he, after having attended Shrewsbury School from 1871-77, devoted himself to classical studies at Corpus Christi College, Oxford, from 1877-81, and took second class in *Litteræ Humaniores*; he taught classics from 1881-90; became university extension lecturer, and has since lectured to large audiences. From 1886-1904 he was a member of the Fabian Society; of the London School Board from 1894-1904; chairman of the School Management Committee, 1897-1904; and member of the Technical Education Board of the London County Council, 1898-1904. He has been lecturer in the London School of Economics since 1896, and is a member of the National Liberal Club. Wallas is author of "Life of Francis Place," 1897; and of a number of various essays. Address: 27 Royal Crescent, W. London.

WALSH, STEPHEN: Member British Parliament, of the Labor Party for Ince, S. W. Lancashire; born 1859; left an orphan; educated at Kirkdale Industrial Schools. He began work in 1874 as a miner at Ashton-in-Mackerfield, and continued till 1880. Having become a trade-unionist, he organized the branch of the Lancashire and Cheshire Miners' Federation. Was member of the Ashton Town Council for eight years. In 1901 he removed to Wigan as miners' agent, and was elected to Parliament in 1906. Address: 8 Swinley Road, Wigan, England.

WAR (see also **MILITARISM**). The following are estimates of the cost of recent wars:

| | Cost | Loss of Life |
|---------------------------------------|-----------------|--------------|
| England-France, 1793-1815..... | \$6,250,000,000 | 1,900,000 |
| Crimean War, 1854-56..... | 1,525,000,000 | 485,000 |
| United States Civil War, 1863-65..... | 3,700,000,000 | 656,000 |
| Franco-German, 1870-71..... | 1,580,000,000 | 290,000 |
| Russo-Turkish, 1876-77..... | 950,000,000 | 180,000 |
| United States Spanish War, 1898..... | 165,000,000 | 2,910 |
| Boer War, 1900-01..... | 1,000,100,000 | 90,898 |
| Russo-Japanese War, 1904-05..... | 2,250,000,000 | 555,900 |

¹ The United States alone.

These figures are only the estimates of the direct cost. The indirect cost to the industrial and economic life of a nation is often vastly more. Ancient wars were probably neither so costly or destructive, altho probably far more destruction took place in ancient times as a result of war than in modern, because wars were so constant. The cost of modern wars tends to diminish them.

WARD, JOHN: Member British Parliament, of Labor Party for Stoke-on-Trent; born 1866. Worked as a navvy on the Manchester Ship Canal, and served in the Soudan, 1885. He became a member of the Social Democratic Federation, and was arrested in Trafalgar Square, 1886. In 1889 he founded the Navvies' Union. He is a member of the Executive Council of the National Democratic League; he was elected to Parliament in 1906, chiefly by the Labor vote. Address: The Navvies, 129 Elmsleigh Road, East Hill, Wandsworth, London, S. W.

WARD, LESTER FRANK: Geologist, botanist, philosopher, but chiefly sociologist; born at Joliet, Ill., June 18, 1841. He received his early education in Illinois till 1860, and in Towanda, Pa., till 1862. He then served in the federal army and after the war entered Columbian (now George Washington) University, Washington, D.C., where he graduated in 1860, and from the law school of that institution in 1871, receiving the additional degrees of M.A. in 1872, and LL.D. in 1897. For seven years he worked in the Treasury Department, was successively assistant geologist, geologist, and from 1881 to 1905 paleontologist of the United States Geological Survey. During all these years the broader aspects of evolution appealed to him, and he devoted most of his leisure time to sociological studies. In 1906 he accepted a call to the professorship of sociology at Brown University. Author of numerous papers and several works on botany and paleontology. His principal sociological works are: "Dynamic Sociology," 1883; "The Psychic Factors of Civilization," 1893; "Outlines of Sociology," 1898; "Pure Sociology," 1903; "Applied Sociology," 1906. Address: Brown University, Providence, R. I.

WARDLE, GEORGE JAMES: Member British Parliament, of Labor Party for Stockport; born 1865 near Burton-on-Trent; began work at eight years as half-timer in Keighley, Yorkshire, and as full-timer at thirteen; in the meanwhile he attended the Wesleyan day-school. At fifteen he became clerk on the Midland Railway, and continued till 1898, when he became editor of the *Railway Review*—the organ of the Amalgamated Society of Railway Servants. He has written a number of pamphlets, and some poems; but is chiefly interested and instrumental in the eluci-

dation of social and labor problems. Was elected to Parliament in 1906. Address: 107 Brownlow Road, New Southgate, N. London, England.

WARNER, JOHN DE WITT: Free-trade writer; born 1851, Schuylar County, N. Y.; graduated in 1872, Ph.B., from Cornell University, and in 1876, LL.B., from the Albany Law School. In 1871 was editor of *Ithaca Daily Leader*; from 1871-74 professor of Latin and German at Ithaca Academy; and from 1875-76 taught the same branches at the Albany Boys' Academy. Represented New York City in the Fifty-Second and Fifty-Third Congresses. Member of Fine Arts Federation, National Sculpture Society, and of the National Society of Mural Painters; president, 1901-3, of the Art Commission of the City of New York; member of Bar Associations of the city and the State of New York, and of the United States; trustee of Cornell University. Author of numerous articles on comparative mythology, free trade, income tax, coinage and currency, single tax, municipal operation, civic art, law reform, etc., etc. Address: 60 Wall Street, New York City.

WARNOTTE, DANIEL: Librarian of Labor Department, Brussels; born 1871 at Brussels; studied law and political science in the University of Brussels; made doctor of laws, 1893. In 1897 was appointed to the post he now occupies as librarian (*Office du travail*). Contributes to *Revue de droit International et de Législation Comparée*; and *Kritische Blätter für die Gesamten Sozialwissenschaften*, etc. M. Warnotte's views in political economy are for the largest exposition of individual activities under an efficient State control. Author: "La Question douanière en Angleterre"; collaborating with Dr. Poëls, "Legislation Comparée des Accidents du travail au point de vue Médicale"; collaborating with M. H. Maut, "La loi sur le repos du Dimanche." Address: Rue Lambermont 2, Brussels, Belgium.

WARREN, JOSIAH: Philosophical anarchist; born near Boston, 1799. When Robert Owen founded the community of New Harmony (q. v.) Warren became interested and joined it. Its failure set him to thinking, and he came to the conclusion that in the community the individual had been made too little of; that the need was not more socialism, but more individualization; secondly, that cost was the true basis of price. (See VALUE.)

Warren determined to test the cost theory, and, about 1827, he started a store in Cincinnati, which he conducted for two years, doing business to the amount of \$150,000. See Warren's "Practical Details of Equitable Commerce" (now out of print). Business was not centralized as now, and the retailer realized large profits. Warren marked his goods with the cost and added 7 per cent for rent, fuel, etc., exclusive of the labor of himself and the employees. This 7 per cent was carefully computed, and was invariable, but it allowed no profit. A clock was kept in the store, and every customer was timed and charged so much an hour for the time of the salesman. The charge for time was reduced with the increase of business. Finally, Warren issued his own money in the shape of labor notes, which he exchanged for the labor notes of his customers. His notes became a popular circulating medium. The experiment satisfied him, and he closed

his store, and later published his principal work, "True Civilization" (1846).

Warren next went to Ohio and started a community based on his ideas. He converted Stephen Pearl Andrews (q. v.). Later he founded Modern Times, a community on Long Island, but neither community prospered. He then lived a sort of hermit life, partly in Princeton, Mass., and died at Charlestown in 1874. He is considered by the philosophical anarchists, with Proudhon, the founder of their system of thought. (See ANARCHISM.)

WARWICK, FRANCES EVELYN, COUNTESS OF: Socialist; born 1861. The countess is a member of the Social Democratic Federation, and tho a prominent personage and leader in society, she is both sympathetically and practically identified with many of the larger public movements of the time. She is one of the Poor Law Guardians, and both at Warwick Castle and at Easton Lodge has established a complete system for the nursing of the sick and the welfare of those in need. Foundress of a college at Studley Castle, Warwickshire, for training the daughters of professional men in horticulture, dairy, bee, and poultry keeping. She has also established on the Essex estate a science and technical school for boys and girls in the rural districts of Essex; and at Warwick, a home for crippled children who are admitted free and for an unlimited length of stay. President of Essex Needlework Guild, and of many other societies. Author: "Warwick Castle and its Earls." Address: Warwick Castle, Warwickshire, England.

WASHINGTON, BOOKER TALIAFERRO: Principal of Tuskegee Institute; born near Hale's Ford, Va., "about 1857 or 1858"; graduated from Hampton Institute, 1875; A.M., Harvard in 1896; LL.D., Dartmouth College in 1901. His most important work was the founding, on July 4, 1881, of the Tuskegee Normal and Industrial Institute for the Training of Colored Young Men and Women, at Tuskegee, Ala., the fame of which is everywhere. Established in 1893 the Tuskegee Negro Conference for the purpose of giving information concerning the actual condition of the masses of Negro people in what is known as the Black Belt of the South; in 1900, with a view to stimulating the enterprises of Negroes along business and industrial lines, he organized the National Negro Business League. Author of "The Future of the American Negro"; "Sowing and Reaping"; "Up from Slavery"; "Story of My Life and Work"; "Character Building"; "Working with the Hands"; "Tuskegee and its People"; and many articles in magazines and elsewhere. Address: Tuskegee Institute, Ala.

WASHINGTONIAN MOVEMENT: This celebrated moral-suasion crusade had its origin in the reformation of a Baltimore drinking club of six men—W. K. Mitchell, a tailor; J. F. Hoss, a carpenter; David Anderson and George Steers, blacksmiths; James McCurley, a coachmaker, and Archibald Campbell, a silversmith. They were induced to change their habits by the address of a temperance lecturer, and signed the following pledge (April 6, 1840): "We, whose names are annexed, desirous of forming a society for our mutual benefit, and to guard against a practise—a pernicious practise—which is injurious to our health, standing, and families, do pledge our-

selves, as gentlemen, that we will not drink any spirits or malt liquors, wine, or cider."

They took the name of "The Washington Temperance Society," and were familiarly known as "Washingtonians." By the end of 1840 this Baltimore organization had 700 members; and under the leadership of John H. W. Hawkins, the most prominent Washingtonian agitator, the crusade spread to other cities and states. Its force was spent by 1843, but the energy developed by it was of great and lasting benefit to the general temperance cause.

WATER-WORKS: Establishments for procuring a plentiful supply of pure water to cities and towns. (For municipalization of water-works, see article PUBLIC OWNERSHIP.)

The first water-works in the United States were built at Boston, in 1652, by the Water-Works Company; the second at Bethlehem, Pa., in 1761. By 1800 the number had increased to sixteen, of which only the one at Winchester, Va., was owned by the municipality. By 1825 there were thirty-two plants, all but five being owned by private companies or individuals. A rapid increase in the municipalization of water-works took place between 1825-55, the percentage changing from 15.6 to 45.3. For ten years there seemed to be a standstill, then the number of works grew rapidly, from 162 in 1865 to 422 in 1875; of the latter number 53.8 per cent were municipal. From 1875-90 the number of works rose from 422 to 1,878, of which only 42.9 per cent were municipal. By 1896 the total number had increased to 3,196, of which 53.2 per cent were municipal. This percentage shows a zigzag line. But on the whole public ownership of the water-works has greatly increased, since 205 plants were changed from private to municipal during the century, while only twenty changed from public to private.

In 1905 there were, including the large cities, nearly 60 per cent municipally owned water-works in the U. S. "The Municipal Year Book" for 1902 had reports from 1,475 plants, divided as follows: 776 municipal; 661 private; 33 both municipal and private; 14 joint; 3 did not reply; and 47 omitted this item in their report.

Of the thirteen largest cities in the U. S., all but one, San Francisco, own their water-works; and of the thirty-eight cities with a population of 100,000 in 1900, all but eight own them: San Francisco, New Orleans, Omaha, Indianapolis, St. Joseph, Scranton, Paterson, and New Haven; two of these—New Orleans and Omaha—are favorable to the change.

The reasons for the changes from private to public are the following: (1) Private ownership was found to be profitable to individuals rather than wholesome to the cities. (2) During the years when municipal ownership went backward in the U. S. (from 1875-90), promoters had discovered the value of franchises, and they secured them from the ignorant city fathers for almost nothing; investors built the plants, and the private owners sold out to the city at high figures—thus making a profit either way. (3) With a higher education and a somewhat higher honesty in civic matters, people became aware of the fact that a matter of such importance as water-supply—on which the health of a city primarily depends—should not be left to the discretion of private individuals, since the temptation to make it a matter of profit was always

lurking in the background. Cities began, therefore, to supply and control their own water—with satisfactory results on the whole. (4) Many advocates of municipal ownership of public utilities saw an opportunity here to illustrate that the public could own and operate these utilities efficiently; they used, consequently, all legitimate means to bring about a change of ownership. (5) The experience of most cities with municipal ownership encouraged others to follow their example.

The fact that water-works are almost the only example of municipal ownership in the U. S., and that the experiment has, with few exceptions, been successful, is an encouraging sign of improved honesty in public affairs.

The average rates charged private consumers by 430 companies, as shown by the "Manual of American Water-Works" for 1889-90, were 43 per cent higher than those charged by 318 cities for the same service. Many of these water-works are very profitable.

For New York City, Mayor Strong, in his message concerning the Department of Public Works (1897), makes the following report from the Bureau of Water-Register:

"For the first time in the history of the city the revenue collected last year from water rents was more than enough to reimburse the city for the entire outlay of the Department of Public Works, which is taken from taxation. To express it in another way, our water rents paid for road pavements, street lighting, care of and repairs to the entire water system, care of and repairs to public buildings, salaries, wages, and all other administrative expenses."

The report of the Water Department of Chicago for 1897 shows that the receipts were \$3,226,000 and the operating expenses \$285,000, leaving net earnings of \$2,941,000. The investment in the Chicago Water-Works, according to the New York *Sun*, was \$28,000,000, so that, besides interest on bonds for this amount, the net profits are \$1,500,000. The public also receives free water in its parks, streets, and public buildings. (For water-works in Europe, see articles BERLIN; BIRMINGHAM; GLASGOW; LONDON; PARIS.)

WATSON, HON. JOHN CHRISTIAN: Member of Parliament for Bland, New South Wales; leader of Federal Parliamentary Labor Party and some time Prime Minister of the Commonwealth. Born Valparaiso, April 9, 1867; became a printer. Member of Legislature of New South Wales, 1894-1901. He first came into prominence as a labor leader when he acted as chairman of the New South Wales Labor Conference, which framed the famous pledge and formed the solidarity of the Labor Party. President of the Trades and Labor Council of Sydney, 1893-94, and president of the Australian Labor Federation, 1895; has been leader of the Federal Labor Party since 1901, and Prime Minister and treasurer of the Commonwealth, April to Aug., 1904. Address: Parliament House, Melbourne.

WATSON, THOMAS E.: Ex-Populist Congressman; born at Columbia, Ga., 1856; studied two years at Mercer College, taught school, and was admitted to the bar in 1875; he practised law in Thomson, Ga.; was a member of the legislature, 1882-83; member of Congress, 1891-93; and re-

sumed practise of law in 1895. As a member of Congress he secured on Feb. 17, 1893, the passage of the first resolution passed by Congress for the appropriation of money toward free rural delivery of the mails. The Populists nominated him vice-presidential candidate in 1896; the People's Party presidential candidate in 1904. He had been engaged in newspaper work several times as editor and owner; and so he began the publication of *Tom Watson's Magazine* in New York, 1905, from which he withdrew in order to establish the *Jeffersonian Magazine* in Atlanta, Ga. He is author of "The Story of France," 1898; "Life of Thomas Jefferson," 1900; "Life of Napoleon," 1902; "Bethany, a Study and Story of the Old South," 1904. Address: Thomson, Ga.

WAXWEILER, ÉMILE: Director of Solvay Sociological Institute, Brussels; born in the late sixties in Belgium; educated at University of Ghent; devoted himself exclusively to the study of economical and social subjects. In 1893 came to study industrial and labor problems in the United States. Returning to Belgium, was given charge of newly created Bureau of Commerce and Industry in the city of Ghent. Later he was appointed to the Bureau of Labor Statistics for the kingdom of Belgium, and completed the census of Belgian industries, which was begun in 1896. Since 1897 professor of the School of Social Science at the University of Brussels, he lectures on political economy, sociology, and statistics. In 1895 was sent by the Belgian Government to study the Sunday-rest problem in Switzerland; he obtained in 1897 first award for the international prize founded by the Musée Social of Paris. In 1901 he was appointed director of the Solvay Sociological Institute at Brussels. Author: "American High Wages"; "Profit-Sharing"; "Outlines of Sociology." Address: Sociological Institute, Parc Leopold, Belgium.

WAYLAND, FRANCIS: Former president of Brown University; economist; born New York, 1796; graduated at Union College in 1813. Studied medicine, but later entered the Baptist ministry. Tutor at Union College, 1817-21; pastor of the First Baptist Church in Boston, 1821-26; president of Brown University, 1827. He died in 1865. His sociological writings are: "Elements of Moral Science" (1835); "Elements of Political Economy" (1837).

WAYLAND, JULIUS A.: Publisher of *The Appeal to Reason*; born Versailles, Ind., 1854; attended the village school for about one year; learned the trade of printing in the village office; then bought the local newspaper and published it for a period of five years; moved to Harrisonville, Mo., where for two years he published the *Cass News*; moved to Pueblo, Col., engaging in the business of printing, publishing, and real estate. In 1890 was converted to socialism; moved to Greensburg, Ind., and there in 1893 started *The Coming Nation*; 1894 removed the plant to Ruskin, Tenn., and commenced a colony. After a year's residence left both paper and colony to establish at Kansas City *The Appeal to Reason*. In 1896 the *Appeal* was moved to Girard, Kan., where it has since been published under the direction of its founder. Mr. Wayland believes in the common ownership of all the means of production and distribution, democratically managed. Address: Girard, Kan.

WEALTH: We consider this subject under four heads: I. Definitions; II. Statistics of Wealth; III. The Concentration of Wealth; IV. Is the Concentration of Wealth Increasing or Decreasing?

I. DEFINITIONS

Wealth is usually defined in economic science as "useful or agreeable things which possess exchangeable value" (Mill). Of this definition Mill says ("Political Economy," "Preliminary Remarks"):

Things for which nothing could be obtained in exchange, however useful or necessary they may be, are not wealth in the sense in which the term is used in political economy. Air, for example, tho the most absolute of necessities, bears no price in the market, because it can be obtained gratuitously; to accumulate a stock of it would yield no profit or advantage to any one; and the laws of its production and distribution are the subject of a very different study from political economy. But tho air is not wealth, mankind are much richer by obtaining it gratis, since the time and labor which would otherwise be required for supplying the most pressing of all wants can be devoted to other purposes. It is possible to imagine circumstances in which air would be a part of wealth.

Senior's definition of wealth, quoted by Jevons ("Theory of Political Economy," p. 175), is the same, that wealth consists of "those things and those things only which are transferable, are limited in supply, and are directly or indirectly productive of pleasure or preventive of pain."

On the other hand, many reform writers identify wealth with well-being on the ground that it is impossible to divorce immaterial factors from material factors, and still be true to the facts of life. John Ruskin, e. g., argues that no article is useful except to those who can use it. Hence he says:

Wealth, therefore, is "the possession of the valuable by the valiant"; and in considering it as a power existing in a nation, the two elements, the value of the thing and the valor of its possessor, must be estimated together. Whence it appears that many of the persons commonly considered wealthy are in reality no more wealthy than the locks of their own strong boxes are, they being inherently and eternally incapable of wealth, and operating for the nation, in an economical point of view, either as pools of dead water and eddies in a stream (which, so long as the stream flows, are useless, or serve only to drown people, but may become of importance in a state of stagnation, should the stream dry); or else as dams in a river, of which the ultimate service depends not on the dam, but the miller; or else as mere accidental stays and impediments, acting not as wealth, but (for we ought to have a corresponding term) as "illth," causing various devastation and trouble around them in all directions; or lastly, act not at all, but are merely animated conditions of delay (no use being possible of anything they have until they are dead), in which last condition they are nevertheless often useful as delays and "impedimenta," if a nation is apt to move too fast.

Some writers on reform distinguish between riches and wealth. Says G. Bernard Shaw in the "Fabian Essays":

It is sometimes said that during this grotesquely hideous march of civilization from bad to worse, wealth is increasing side by side with misery. Such a thing is eternally impossible; wealth is steadily decreasing with the spread of poverty. But riches are increasing, which is quite another thing. The total of the exchange values produced in the country annually is mounting perhaps by leaps and bounds. But the accumulation of riches, and consequently of an excessive purchasing power, in the hands of a class, soon satiates that class with socially useful wealth, and sets them offering a price for luxuries. The moment a price is to be had for a luxury, it acquires exchange value, and labor is employed to produce it. A New York lady, for instance, having a nature of exquisite sensibility, orders an elegant rosewood and silver coffin, upholstered in pink satin, for her dead dog. It is made; and meanwhile a live child is prowling barefooted and hunger-stunted in a frozen gutter outside. The exchange-value of the coffin is counted as part of the national wealth; but a nation which cannot afford food and clothing for its children cannot be allowed to pass as wealthy because it has provided a pretty coffin for a dead dog.

II. STATISTICS

A. The United States

ESTIMATED TRUE VALUE OF ALL PROPERTY, 1904
From special census report (1907)

| STATES OR TERRITORY | Total | Real property and improvements ¹ | Live stock | Farm implements and machinery | Manufacturing machinery, tools, and implements | Gold and silver coin and bullion | Railroads and their equipment | Street-railways, ships, wharves, water-works, etc. ² | All other ³ |

¹ Exclusive of railroads, street-railways, telegraph and telephone systems, privately owned water-works, and privately owned central electric light and power stations, which in certain states are classed as real property.
² Including telegraph and telephone systems, privately owned electric light and power stations, Pullman and private cars, and furniture, carriages, and kindred property.
³ Including products of agriculture, manufactures, and mining; imported merchandise; clothing and personal adornments; and furniture, carriages, and kindred property.

For the progress and per-capita wealth of the U. S. at various dates, see article PROGRESS. Says Dr. Josiah Strong ("Social Progress," 1904):

Mr. Mulhall wrote in 1895: "The merchandise transported by rail in the U. S. is shown by official returns to be double the amount of land-carriage (at least by railway) of all the other nations of the earth collectively." What a comment on our industrial and commercial activity, that the 70,000,000 people of the United States transport by rail twice as much merchandise as the remaining 1,400,000,000 of mankind! In 1895 we had 802,000 miles of telegraph wire—enough to encircle the earth thirty-two times, or to cross the continent 267 times.

The energy or working power of the nation, including hand, horse, and steam power, was equal, in 1895, to 129,306,000,000 foot-tons daily; that is, it was equal to lifting that number of tons one foot every day. Our working power is more than twice as great as that of Great Britain, and is nearly equal to that of Great Britain, Germany, and France combined.

With this power directed chiefly to the creation of wealth, it is not strange that we are growing rich more rapidly than any other people. Our wealth in 1820 was less than \$2,000,000,000. In twenty years it had doubled, and in forty years it had increased eightfold. During the thirty years following, from 1860 to 1890, we created and accumulated \$49,000,000,000—\$1,000,000,000 more than the entire wealth of Great Britain; and, notwithstanding the great increase of population, our wealth per capita doubled during this interval.

The wealth of the Old World is the accumulation of many centuries, but ninety-four per cent. of ours has been created and accumulated since 1840; and we are now increasing it at the rate of \$8,000,000 a day.

From the labor standpoint, labor receives but a small proportion of this wealth. The following is an estimate made from census returns by the "International Institute of Social Service" (Socialist):

The total value of production in 1900, \$24,500,000,000; the total value of labor power used in production, \$5,815,000,000; therefore the share of productive labor in its product as it appeared in the census year 1900 was 23.74 per cent, or less than one quarter. As shown, by industries:

1. The total value of the various products of agriculture, the forests, the mines, the quarries, the fisheries, manufacture and the hand trades, including transportation and distribution, was \$24,500,000,000.

2. The number of wage-workers (men, women, and children from ten to fifteen years of age) reported in the census as employed in the above-named industries, also of those engaged in the transportation and distribution of the products, and including all the necessary labor of accountants, clerks, salesmen, saleswomen, etc., was 15,134,000. Their total earnings were \$4,129,000,000.

3. The number of farmers, farm tenants, small manufacturers, artisans, shopkeepers, and others actually performing productive work was 5,110,000. The value of their labor power, liberally estimated at rates notably higher than the average of men's wages for the same class of work, was \$1,626,000,000; all above this value being obviously "surplus-value," or profit, which they got, not as workers, but as owners of capital in the forms required by their respective occupations.

Therefore, to productive labor went 23.74 per cent of its product, and to exploiters of productive labor, 76.26 per cent of its product.

B. Great Britain

The following statistics are a portion of a Fabian Tract on "Wealth" (No. 5, tenth edition, June, 1906):

The annual income of the United Kingdom has been estimated by the following authorities:

| | |
|---|----------------|
| Sir Louis Mallet, K.C.S.I. (India Office), 1883-1884, "National Income and Taxation" (Cobden Club), p. 23..... | £1,289,000,000 |
| Prof. Leone Levi (King's College, London), <i>Times</i> , Jan. 13, 1885..... | 1,274,000,000 |
| Prof. A. Marshall (Cambridge University), "Report of Industrial Remuneration Conference," p. 194 (Jan., 1885), upward of..... | 1,125,000,000 |
| Mr. Mulhall (1892), "Dictionary of Statistics," p. 320, income for 1889..... | 1,285,000,000 |
| Sir R. Giffen, "The Wealth of the Empire," <i>Journal of Royal Statistical Society</i> , vol. xvi, part iii, 1903..... | 1,750,000,000 |
| Mr. A. L. Bowley, M.A. (appointed teacher of statistics, University of London), <i>Economic Journal</i> , Sept., 1904; income for 1903..... | 1,800,000,000 |
| Mr. L. G. Chiozza Money, M.P., "Riches and Poverty"; income for 1904..... | 1,710,000,000 |

The gross assessments to income tax have risen (1881-82 to 1901-2) by £265,542,486 (Inland Revenue Report, 1897-1898, C.—4,474 and Cd.—1,717). Allowing for a corresponding rise in the incomes not assessed and in the wages of manual labor, we may estimate the income for 1901-2 at not less than £1,800,000,000. The population in 1901 being nearly 41,500,000 (Cd.—1,727), the average annual income is about £43 per head, or £174 per adult man.¹ In 1840 it was about £20² and in 1860 £26² per head (Mr. Mulhall, "Dictionary of Statistics," p. 245).

The total profits from the ownership of lands, houses, tithes, etc., as assessed for income tax in 1901-2, was £238,231,937; the rents of mines, quarries, iron-works, gas-works, water-works, canals, fishings, shootings, markets, tolls, etc., amounted to £40,988,572 ("Inland Revenue Report, 1902-3, Cd.—1,717). Many of these are notoriously far from being fully assessed. The total "rent" of the United Kingdom must therefore amount to at least £290,000,000, or nearly one sixth of the total produce.

The profits of public companies, foreign investments, railways, etc., assessed to income tax in the United Kingdom in 1901-2 amounted to £260,274,742. The interest payable from British public funds (rates and taxes) was, in addition, £22,757,110, and from Indian, colonial, and foreign governments, £28,126,796 ("Inland Revenue Report, 1901-2, Cd.—1,717).

We have, however, to add the interest on capital employed in private undertakings of manufacture or trade. This is included with "wages of superintendence," in business profit, both for the purpose of the income-tax returns and in ordinary speech. Sir R. Giffen estimated it, in 1884, apart from any earnings of personal service, at £89,000,000 ("Essays in Finance," vol. ii., p. 403). Allowing for the increase since then, the total amount of interest cannot therefore be less than £360,000,000.

Adding hereto the rent mentioned in the preceding section, we have a total of £650,000,000 for rent and interest together.

But those who enjoy the vast unearned income just mentioned cannot all be accurately described as the "idle rich," tho they would forego none of it by refusing to work. If they are disposed to increase it by leading active lives, they can do so; and most of them adopt this course to some extent, especially those whose share is insufficient for their desires.

The numbers and total income of this large class cannot be exactly ascertained. It includes workers of all grades, from the exceptionally skilled artisan to the Prime Minister, and from the city clerk to the President of the Royal Academy.

Division of Wealth

It is convenient for statistical purposes to include in it all those who do not belong to the "manual-labor class." If we take the "rent of ability" to have increased in the same proportion as the assessments to income tax this prosperous body may be estimated to receive for its work as profits and salaries about £460,000,000 annually.

The total amount of rent, interest, profits, and salaries was estimated some years ago as follows:

| | |
|--|--------------|
| Prof. Leone Levi, <i>Times</i> , Jan. 13, 1885..... | £753,000,000 |
| Prof. Alfred Marshall, "Report of Industrial Remuneration Conference," p. 194 (1885).... | 675,000,000 |
| Sir R. Giffen, "Essays in Finance," vol. ii., p. 467 (1886)..... | 720,000,000 |
| Mr. Mulhall, "Dictionary of Statistics," p. 246..... | 818,000,000 |
| Mr. A. L. Bowley, <i>Statistical Society's Journal</i> , vol. lviii., part 2, p. 284 (1891)..... | 912,000,000 |

Since these estimates were made the wealth of the country has grown greatly, and on the basis of the increase in gross assessments to income tax, we estimate that the total drawn by the legal disposers of what are sometimes called the "three rents" (of land, capital, and ability) amounts at present to about £1,100,000,000 yearly, or just under two thirds of the total produce.

The total amount of wages was at the same time estimated by the statisticians:

| | |
|--|--------------|
| Prof. Leone Levi (as above)..... | £521,000,000 |
| Prof. A. Marshall (as above)..... | 500,000,000 |
| Mr. Mulhall, "Dictionary of Statistics," p. 320..... | 467,000,000 |
| Sir R. Giffen, "Essays in Finance," vol. ii., p. 467..... | 550,000,000 |
| Mr. J. S. Jeans, <i>Statistical Society's Journal</i> , vol. xlvii., p. 631..... | 600,000,000 |
| Mr. A. L. Bowley (as above)..... | 699,000,000 |

¹ In 1843 the total was (for Great Britain only) £95,284,497; in 1855 (for the United Kingdom) £124,871,885.

² These estimates, which are based on average rates of wages, multiplied by the number of workers, assume, however, reasonable regularity of employment, and take no account of the fact that much of the total amount of nominal wages is reclaimed from the workers in the shape of rent. Much must, therefore, be deducted to obtain their real net remuneration.

Allowing for the increase since these estimates were made we may safely say that the manual-labor class receives for all its millions of workers only some £690,000,000.

| | |
|---|----------------------------|
| Rent..... | £290,000,000 |
| Interest..... | 360,000,000 |
| Profits and salaries..... | 460,000,000 |
| Total (that is, the income of the legal proprietors of the three natural monopolies of land, capital, and ability)..... | 1,110,000,000 ¹ |
| Income of manual-labor class..... | 690,000,000 |
| Total produce..... | £1,800,000,000 |

C. Other Countries

COMPARATIVE WEALTH OF COUNTRIES
Estimated by Mulhall, in 1896, in millions of dollars

| COUNTRIES | Farms | Railways | Buildings | Merchandise | Sundries | Total |
|------------------------|--------|----------|-----------|-------------|----------|---------|

| Netherlands..... | 4,500,000,000 |
| Portugal..... | 2,500,000,000 |
| Switzerland..... | 2,400,000,000 |

For a comparison of the world's wealth in the nineteenth and preceding centuries, we of course have no exact data, but may refer to Mr. Gladstone's well-known estimate that all the wealth which could be handed down to posterity, produced during the first eighteen hundred years of the Christian era, was equaled by the production of the first fifty years of the nineteenth century, and that as much more was produced during the next twenty years. If this is a reasonable estimate, as it would seem to be, it is safe to say that for the enrichment of the world there has been more than three times as much wealth produced during this one century as during the eighteen centuries preceding.

III. IS WEALTH CONCENTRATING?

TWO VIEWS

Those who deny any concentration of wealth do not deny that in the U. S. and Great Britain the rich are getting richer, but they assert that the poor are also getting richer, and on the whole gaining on the rich. Perhaps the strongest argument for this view in the U. S. has been made by Edward Atkinson in a series of articles in the *Century* (vol. xxxiv.), quoting census and other

¹ In this connection it may be mentioned that the total income of the charities of the United Kingdom, including endowments, amounts to £10,049,000, or one per cent of the foregoing total; £2,040,000 of this, it may be added, is expended upon Bible societies alone (Mulhall, "Dictionary of Statistics," p. 112). The total cost of poor relief in 1901-2 was £15,305,642.

reports to show that on the whole wages are rising and prices falling, while, on the other hand, rates of interest are falling, so that the poor are getting an ever-increasing share of an ever-increasing product, while the rich have to invest larger amounts of capital at an ever-decreasing rate of interest.

Critics of this view show that until recently wages have not risen since 1873, and that the recent rise of wages has been accompanied by a rise of prices, some think sufficient to offset all rise in wages. Except where strong unions have raised the rate, it is asserted that wages, if raised at all, have risen very little. (See article "Wages.") As for falling interest, this is not denied, but this is no proof that profits and dividends have not risen.

The ordinary view that wealth is concentrating, to say the least, has strong support. Dr. Spahr, in his "Present Distribution of Wealth" (1896), from an examination of the surrogate court records of thirty-six counties in New York State, outside of New York City, and applying the proportion to the nation at large, comes to the conclusion that seven-eighths of the families hold but one-eighth of the national wealth, while one per cent of the families hold more than the remaining ninety-nine per cent. He constructs the following table:

| ESTATES | Number | Aggregate wealth | Average wealth |
|--|------------|------------------|----------------|
| The wealthy classes, \$50,000 and over... | 125,000 | \$33,000,000,000 | \$264,000 |
| The well-to-do classes, \$50,000 to \$5,000... | 1,375,000 | 23,000,000,000 | 16,000 |
| The middle classes, \$5,000 to \$500... | 5,500,000 | 8,200,000,000 | 1,500 |
| The poorer classes, under \$500..... | 5,500,000 | 800,000,000 | 150 |
| | 12,500,000 | \$65,000,000,000 | \$5,200 |

Professor Mayo-Smith has attempted to challenge Dr. Spahr's conclusions, but with small success. (See Professor Ely's "Evolution of Industrial Society," chap. vi., 1903). Says Dr. Spahr:

Since the completion of this study, a volume has appeared that must set at rest all question as to extreme moderation of the estimates reached. Part ii. of the "Report of the Massachusetts Bureau of Labor Statistics for 1894," publishes the inventoried probates for the entire State of Massachusetts during the three years 1889, 1890, and 1891. Altho the estates for which no inventories are filed are, as a rule, the largest, the following concentration of property is exhibited: ... the estates of \$50,000 and over aggregated fifty-five per cent of the total amount of property, while estates less than \$5,000 aggregated but eleven per cent of the total.

It must be remembered, too, that Mr. G. K. Holmes, expert on wealth statistics for the tenth census, found that 0.3 per cent of the people owned 20 per cent of the wealth; 8.97 per cent of the people 51 per cent of the wealth; and 91 per cent of the people only 29 per cent of the wealth.

In Great Britain the strongest argument that wealth is not concentrating has probably been made by Sir R. Giffin, president of the English Statistical Society. See his "Progress of the Working Classes," and for an answer to this see C. B. Spahr's "Present Distribution of Wealth," pp. 15-18. A more popular argument has been made by Mr. W. H. Mallock in his "Classes and Masses." He does not deny that there are absolutely more poor to-day in England than formerly, but contends that there are not so many

relatively to the population, while that the great advance of numbers has been of the middle class. If one limits the wealthy to the very wealthy, none contend that they have grown in numbers; it is only contended that they have grown in wealth, and this contention Mr. Mallock dodges. For the facts involved see the preceding page.

Concentration of power, however, no one denies, especially in the U. S. We give some typical and authoritative quotations:

Who controls the United States?
In *The World's Work* for Dec., 1903, Mr. Sereno S. Pratt undertakes to answer this question. He says in brief—we condense his words:

One twelfth of the estimated wealth of the U. S. is represented at the meeting of the board of directors of the United States Steel Corporation.

They represent as influential directors more than 200 other companies. These companies operate nearly one half of the railroad mileage of the U. S. They are the great miners and carriers of coal. The leading telegraph system, the traction lines of New York, of Philadelphia, of Pittsburgh, of Buffalo, of Chicago, and of Milwaukee, and one of the principal express companies, are represented in the board. This group includes also directors of five insurance companies, two of which have assets of \$700,000,000. In the Steel Board are men who speak for five banks and ten trust companies in New York City including the First National, the National City, and the Bank of Commerce, the three greatest banks in the country, and the head of important chains of financial institutions. Telephone, electric, real-estate, cable, and publishing companies are represented there, and our greatest merchant sits at the board table.

What the individual wealth of these men is, it would be impossible and beside the point to estimate; but one of them, Mr. John D. Rockefeller, is generally esteemed to be the richest individual in the world. But it is not the personal, but the representative, wealth of these men that makes the group extraordinary. They control corporations whose capitalizations aggregate more than \$9,000,000,000—an amount (if the capitalizations are real values) equal to about the combined public debts of Great Britain, France, and the U. S. It is this concentration of power which is significant. There were at the time of the last statement 69,955 stockholders in the Steel Corporation. But the control of this corporation is vested in twenty-four directors, and this board of directors is guided by the executive and finance committees, which in turn are largely directed by their chairmen, who are probably selected by the great banker who organized the corporation and in a large part sways its policy.

In 1897 it was estimated that the stocks of the railroads in the U. S. were held by 950,000 persons. Since then there has been an immense increase in the number of stockholders, while at the same time the concentration of control has gone on rapidly, so that less than a dozen men control the property owned by more than a million of shareholders.

The Pennsylvania Railroad has 34,500 owners, but is controlled by a handful of capitalists, among whom two or three constitute the dominating force.

The manufactures of the U. S. are owned by 708,623 individuals, the capital represented being \$9,831,486,500, an average of \$12,463 to each person; a very fair division of wealth. But the more important of these companies—those whose output is largest and whose influence on the markets is most powerful—are under the control of a comparatively small number of men.

Of the banking power of the U. S., nearly one half is in New York and the other Eastern states. Of the aggregate of loans made by the national banks on Sept. 15, 1903, amounting to \$3,280,127,480, the amount outstanding in the banks of New York, Chicago, and St. Louis, the three central reserve cities, was \$877,934,942.

Examinations show that concentration of control of these great city banks has gone so far that a comparatively small group of capitalists possesses the power to regulate the flow of credit in this country. In the last analysis it is found that there are actually only two main influences, and that these are centered in Mr. Morgan and Mr. Rockefeller. It is possible to express in approximate figures the extent of the Morgan influence. It is as follows:

| | |
|---|-----------------|
| Insurance companies, assets..... | \$1,063,000,000 |
| Banks and trust companies, deposits..... | 630,000,000 |
| Railroad capitalization, par value..... | 2,447,171,300 |
| United States Steel Corporation, par value..... | 1,528,000,000 |
| International Mercantile Marine, par value..... | 195,000,000 |
| General Electric, par value..... | 45,000,000 |
| International Harvester, par value..... | 120,000,000 |
| Other industrials, par value..... | 240,000,000 |

\$6,268,171,300

1 Quotations by courtesy of *The World's Work*. Copyright, Doubleday, Page & Co.

Mr. Moody in his "Truth About the Trusts" has the following to say of the Standard Oil or Rockefeller group of financiers:

These men either entirely control or make their influence felt to a marked degree in all the greater trusts. They are in fact the real fathers of the trust idea in this country, and, of course, have always been the controlling factors in that most far-reaching and successful of all trusts, the Standard Oil Company. This latter corporation, with a par value capitalization of \$97,500,000, absolutely dominates the oil industry of the U. S., supplying 84 per cent of the domestic demand of oil, and over 90 per cent of the export demand. Furthermore, it produces in the neighborhood of 200 different by-products of oil, and in nearly all of these latter industries there are said to be large profits which contribute to an important extent in making up the enormous earnings of the trust. The dividends of the Standard Oil Trust are more than \$40,000,000 per year, and its net profits are reported to exceed over \$60,000,000 per annum.

But it is not merely in oil and its allied industries that the Rockefeller interests are dominant. They are the controlling factors in the Copper Trust and the Smelters' Trust, and are also closely identified with the mammoth Tobacco Trust, which now practically encircles the globe. Furthermore, while not entirely dominant, they are interested in and display a marked influence in the great Morgan properties, such as the United States Steel Corporation. In the hundreds of smaller industrial trusts, the Rockefeller interests are also conspicuous in many ways.

Coming to the franchise aggregations, we find that everywhere the Standard Oil influence is most prominent. The Rockefeller interests practically dominate the entire public service aggregations of Greater New York, represented by over \$725,000,000 of capital; they are allied in interest with the well-known United Gas Improvement Company of Philadelphia, which is itself the leading corporation of the famous Philadelphia or Widener-Ellkins group, and which dominates the public utility interests in a number of the largest centers of population in the U. S., and in addition controls the lighting interests of a score or more of the smaller American cities.

And turning to the steam-railroad field, we find that the Standard Oil interests are one of the conspicuous factors and are steadily increasing their influence there. One of the

Rockefeller Interests

greater groups (the Gould-Rockefeller) is, of course, directly dominated by them; but, as a matter of fact, the Standard influence is felt quite forcefully in all the railroad groups, and this influence is showing a steady growth throughout the entire steam railroad field. It is now freely predicted in Wall Street that the next decade will see the Rockefeller interests the single dominating force in the world of railway finance and control.

The great Rockefeller alliances in the railroad and industrial fields are supplemented and welded together, as it were, through the New York city financial interests of the group. Their banking influence is of very great importance, and their ramifications are far-reaching and of great effectiveness. Thus, the Standard Oil chain of banking institutions, headed by the great National City Bank, with a capital and surplus of \$40,000,000, and deposits exceeding \$200,000,000, includes also the Hanover National Bank, the Second National Bank, the United States Trust Company, the Farmers' Loan and Trust Company, the Central Realty Bond and Trust Company, and a number of smaller institutions. Some of these banks (particularly the National City) have strong dominating influences with the larger banking institutions of other great cities. The Standard interests are also closely allied with great life-insurance companies, such as the Equitable and the Mutual of New York.

The Morgan group of industries and transportation companies is, next to the Standard Oil interests, by far the most important. In fact, the only gigantic interests or groups which can in any sense be considered as on the same plane are the Rockefeller and Morgan groups. There are, it is true, a number of other large groups in special lines, but these two are the only distinctively great interests that dominate immense areas in all lines, steam transportation, public service, industrial, financial, banking, insurance and so forth. The great Morgan enterprises in the industrial world are the Steel and Shipping Trusts, the Electrical Supply Trust, the Rubber Trust, and a score or more of smaller aggregations. In the public utility field the Morgan interests dominate a series of lesser enterprises, but have never been so conspicuous in these lines as have the Rockefeller financiers.

But it is in the railroad world that the Morgan influence makes its greatest claim for public attention. The Morgan group of steam-railroad properties embraces over 47,000 miles of lines, or nearly twice the mileage of any other one group; and its capitalization exceeds \$2,265,000,000, a sum far in excess of that of any of the other five groups, and, in fact, amounting to nearly 25 per cent of all the group railroad capital of the U. S. The Morgan railroad properties are nearly all located in growing sections of the country, and there is probably a very small proportion of worthless and unprofitable mileage

embraced in the various Morgan systems. Another feature about the Morgan group is that in most cases the lines embraced absolutely dominate certain sections of the country; such as, for instance, the entire South and the great Northwest.

The Morgan domination, like the Standard Oil, makes itself felt through the means and influence of large metropolitan financial institutions and great banks, such as the National Bank of Commerce, First National Bank, Chase National Bank, and Liberty National Bank. The great life-insurance companies, such as the New York Life, and trust companies, such as the Mercantile, Guaranty, and Central Trust, are generally rated as being at least partially under the Morgan control.

It should not be supposed, however, that these two great groups of capitalists and financiers are in any real sense rivals or competitors for power, or that such a thing as "war" exists between them. As a matter of fact, they are not only friendly, but they are allied to each other by many close ties, and it would probably require only a little stretch of the imagination to describe them as a single great Rockefeller-Morgan group. It is felt and recognized on every hand in Wall Street to-day that they are harmonious in nearly all particulars, and that instead of there being danger of their relations ever becoming strained, it will be only a matter of a brief period when one will be more or less completely absorbed by the other, and a grand close alliance will be the natural outcome of conditions which, so far as human foresight can see, can logically have no other result.

Around these two groups, or what must ultimately become one greater group, all the other smaller groups of capitalists congregate. They are all allied and intertwined by their various mutual interests. For instance, the Pennsylvania Railroad interests are on the one hand allied with the Vanderbilts, and on the other with the Rockefellers. The Vanderbilts are closely allied with the Morgan group, and both the Pennsylvania and Vanderbilt interests have recently become the dominating factors in the Reading system, a former Morgan road, and the most important part of the anthracite coal combine, which has always been dominated by the Morgan people. Furthermore, the Goulds, who are closely allied with the Rockefellers, are on most harmonious terms with the Moores of the Rock Island system and the latter are allied in interests quite closely with both the Harriman and the Morgan group. The Rockefeller and Morgan group (which may be regarded as one) therefore really constitute the heart of the business and commercial life of the nation.

Professor Gustav Schmoller (*Bulletin de l'Institut international de Statistique*, Rome, 1896, No. 17, vol. ix.) comes to the conclusion that wealth has not concentrated much more in England than in Rome, Venice, Augsburg, etc. In Germany he finds, roughly speaking, 2 per cent of the wealth in the upper classes, 54 per cent in the middle classes, and 44 per cent in the lower classes.

WEBB, BEATRICE: Economic writer; daughter of Richard Potter, some time president of the Grand Trunk Railway of Canada, etc.; born 1858. A pupil of Herbert Spencer, she studied working-class life in Lancashire and East London; in 1885 joined Mr. Charles Booth in his social investigations, and contributed articles, on the docks, the tailoring trade, and the Jewish community, to *Life and Labor of the People*. In 1888 she gave her experience in sweating-dens to the House of Lords Committee on Sweating. In 1891 she published "The Cooperative Movement in Great Britain." In 1892 she married Sidney Webb (q. v.). Between that date and the present, she has collaborated with her husband in five extensive works on Trade Unionism and Local Government. (See WEBB, SIDNEY.) She is a member of the Fabian Society (London). In 1906 she was appointed a member of the Royal Commission on the Poor Law.

WEBB, SIDNEY: Economist, author, barrister at law, LL.B. (London University); born 1859 in London; educated in Switzerland and Germany; entered English civil service in 1878, filling places in the War Office, Inland Revenue and Colonial offices, from which he retired in 1891.

Lecturer on public administration at London University; chairman of the governors of the London School of Economics and Political Science in that university. A leading member of the London Fabian Society, since 1883, elected in 1902 for Deptford to the London County Council, on which he still sits, and in which he has filled the offices of chairman of Local Government Committee and chairman of the Technical Education Board. From 1900 a member of the Senate of the reorganized London University, and chairman of the Board of Studies for Economics and Political Science. Member of Royal Commission on Trade Union Law, 1903-4. Author: In collaboration with his wife, Beatrice Potter (*q. v.*), "History of Trade Unionism" (1894); "Industrial Democracy" (1897); "Problems of Modern Industry" (1898); "The Parish and the County" (1906); "The Manor and the Borough" (1907); and alone, "Socialism in England" (1889); "The London Programme" (1891); "Labor in the Longest Reign" (1897); "London Education" (1904); and in conjunction with Harold Cox, "The Eight Hours' Day" (1891). Address: 41 Grosvenor Road, Westminster Embankment, London.

WEITLING, WILHELM: A pioneer of German socialism; born Magdeburg in 1808. Became a tailor, but later traveled through Germany, declaring that he had been converted to communism by the reading of the New Testament; preached a Utopian socialism, mainly fashioned after the ideas of Fourier and Cabet. In 1847 went to America, but returned to Germany at the Revolution of 1848. Later went again to America, and formed a Socialist society in New York City called the Arbeiterbund. Interested himself for four years in a socialistic colony situated in Wisconsin, but remained mainly in New York, living as a clerk, but devoting himself to reform, inventions, and science. His constructive idea was a federation of the families of the world, with leaders chosen by acclamation, who should divide the products of labor, giving to all a fixt share, and to those who produced more than the average certain luxuries, on condition of their being soon consumed to prevent accumulation. Died in 1874. Author: "Die Menschheit wie sie ist, wie sie sein sollte"; "Garantien der Harmonie und Freiheit"; "Das Evangelium eines armen Sünders."

WELLS, DAVID AMES: Economist; born 1828 at Springfield, Mass.; graduated at Williams College, 1847; Lawrence Scientific School, Cambridge, in 1851. Engaged for the next ten years in scientific pursuits and inventions in chemistry. Visited in 1862 and 1867 Europe on commissions of the United States Government; 1866-70 U. S. Special Commissioner of Revenue. In 1872 became university lecturer on political economy at Yale College. Mr. Wells prepared fifteen important reports for the Government of the U. S. and numerous papers for scientific associations both in Europe and America. He is best known, however, for his able advocacy of free trade, civil-service reform, and gold monometalism. He died in 1898. Author: "The Creed of the Free Trader" (1875); "Robinson Crusoe's Money" (1876); "Practical Economics" (1886); "Economic Changes" (1889); "Relation of the Tariff to Wages" (1888).

WELLS, HERBERT GEORGE: Novelist, sociologist; born Bromley, Kent, England; educated at a private school, at Midhurst Grammar School, and Royal College of Science, where he received first class honors in zoology, B.Sc. Associate of the International Institute of Sociology; honorary life member National Union of Shop Assistants. Mr. Wells has wrought nobly for the cause of socialism in England, giving it always the valuable support of his pen, especially in his many novels of socialistic interest and bearing. Member of the Fabian Society. Author: "Anticipations"; "The Discovery of the Future"; "Mankind in the Making"; "The Food of the Gods"; "A Modern Utopia"; "New Worlds for Old"; "The Days of the Comet"; "The Future in America." Address: Spade House, Sandgate, Kent, England.

WESTCOTT, BROOKE FOSS: Bishop, Christian Socialist; born near Birmingham in 1825. Educated at Trinity College, where he was successively scholar, fellow (1849), and professor of divinity (1876). Was also at different times assistant master at Harrow, a canon of Peterborough and of Westminster, chaplain to the queen and to the Archbishop of Canterbury, and was consecrated Bishop of Durham in 1890. At one time was president of the Christian Social Union (*q. v.*). Besides numerous writings on Biblical and religious subjects he wrote "Social Aspects of Christianity" and "The Incarnation and Common Life." Died in 1901.

WESTERGAARD, HARALD LUDVIG: Danish professor of political economy; born 1853 at Copenhagen, Denmark; studied mathematics and political economy at home and abroad. In 1883 appointed as extraordinary professor of statistics and political economy at the University of Copenhagen. In 1886 appointed ordinary professor in the chair he still occupies. Dr. Westergaard has chiefly been engaged in studies concerning the theory of statistics, life-insurance, and vital statistics. Corresponding member of British Economic Association; honorary member of Royal Statistical Society; member of Royal Commission to consider workmen's unemployment and invalidity. He is greatly interested in matters of labor legislation. In 1898 founded a Christian Social Union. Author: "Die Lehre von der Mortalität und Morbilität," "Grundzüge der Theorie der Statistik," and, in cooperation with Rubin, "Statistik der Ehen," besides several investigations published in German and English journals of economy. Address: Scherfigsve 3 Strj., Copenhagen, Denmark.

WESTERN FEDERATION OF MINERS, THE: A federation of miners west of the Mississippi, organized in Butte, Mont., in 1893. It is not affiliated with the American Federation of Labor, early in its history declared for political socialism, and, occasioned perhaps by the unsettled life of the western miners, has developed into the most radical and turbulent of the labor organizations of the United States. It has been accused of practising, aiding, and countenancing every form of violence and crime in its struggles against the capitalist owners of the mines, charges on the other hand vehemently denied by its partizans, with counter-charges of conspiracy, crime, and violence on the part of the capitalists. A brief

summary of representative views will be found below:

I. A MEDIUM VIEW

In an interesting and informed article in the *Outlook* (May 19, 1906), Mr. William Hand makes the following statements:

The western mines are full of long-limbed, frank-eyed men who have adventured themselves far and wide upon the face of the earth. There are eastern miners who were black-listed after leading unsuccessful strikes. There are cowboys grown tired of the trail. There are farmers who preferred prospecting to plowing. There are city men who burst the bars of their cages to breathe the open air of the West. These adventurous characters, going out into a new country and plunging into the virgin, everlasting hills, where it would seem that at last all men would stand on the same footing, have suddenly discovered that amid these primitive surroundings the modern industrial system is not only found, but is found at its worst.

No one would try to find a parallel anywhere else on earth for the reckless unscrupulousness and maddening insolence of the corporations of the Rocky Mountain States. And practical anarchism among corporations is always a strong promoter of theoretical socialism among trade-unions. If the latter is too theoretical, it at least cannot be said that the former is not sufficiently practical.

The fact is that the members of the Citizens' Alliance and the members of the Western Federation of Miners are brothers under their skins. They come in the main from exactly the same breed. Two men go out prospecting. They come from the same town in Ohio. Their claims are half a mile apart. One man strikes gold. The other doesn't. One man becomes a millionaire, and a member of the Mine-Owners' Association. The other becomes a workman and a member of the Western Federation. When you look at a group of mine-owners and then at a group of Western Federation officials, you are struck with their native resemblance to each other and with their common Americanism. They were all of them American adventurers before they became employers and employees.

Practically identical in breed, the mine-owners and the miners are practically identical in temperament. They transact their affairs on both sides with an untrammelled recklessness which is appalling, but which, if the distinction be admitted, savors of anarchy rather than illegality. . . . The lawlessness of the Rocky Mountains is the lawlessness of men not yet reduced to order. . . .

The least farcical of all the trials in connection with these outrages was that which followed the attempt at train-wrecking on the Florence & Cripple Creek Railroad. Here there was a "confession" by a man named McKinney. McKinney said he had committed the deed in company with certain unionists. On cross-examination he was forced to admit that he was a detective in the employ of agents of the Mine-Owners' Association. This does not mean that the mine-owners themselves were cognizant of his employment. On further cross-examination McKinney was forced further to admit that he had been ordered to secure the wrecking of a train for the purpose of discrediting the Federation. The cases against the men accused by McKinney were at once dismissed. But McKinney himself was never tried. S. D. Crump, attorney for the Mine-Owners' Association, went on his bond.

At the same time it would be absurd to say that there is not a possibility that in certain cases the responsibility may rest upon profligate and abandoned members of the Western Federation. There are such men in the mines of the West, and they are accustomed to deeds of violence in personal disputes, in business disputes, and in trade-union disputes. All that can be said with certainty is that there has as yet been no proof.

II. THE LABOR VIEW

The following is a summary of the general labor view:

The Western Federation of Miners have neither committed nor countenanced murder, crime, illegality, nor any deeds of force, save such as were legal and to which they were driven by the conspiracy and illegal and criminal force used by the capitalists in their endeavor to break up the Federation. This is asserted of the Cripple Creek strikes of 1894 and 1904, of the Cœur d'Alene outrages (see Cœur d'ALENE), of the explosions in the Victor and Independence mines, and particularly of the assassination of ex-Governor Steunenberg, of Idaho, Dec. 30, 1905.

According to their view of this case and of the resultant trial, it was a conspiracy of the Mine-Owners' Association or its agents—principally the Pinkerton Detective Agency—to break up the Western Federation of Miners, by the conviction of the leaders, among others, of Charles H. Moyer, the president of the Federation, and William D. Haywood, its secretary. The defense asserts that Haywood, Moyer,

and George Pettibone were illegally kidnapped, taken to Idaho in a special train by Pinkerton detectives and others, arrested there, confined in the Idaho state penitentiary, transferred to the Caldwell jail and finally to the Ada County jail at Boise. Meanwhile one Harry Orchard, a self-confessed gambler, murderer, and criminal, confessed to the dynamiting of Steunenberg, but implicated Moyer, Haywood, Pettibone, and others, as having aided in the outrage with money, etc. The labor view is that James McFarland, the Pinkerton detective, obtained the "confession" under scarcely veiled promises of immunity. After fifteen months' imprisonment, William D. Haywood was put on trial separately, May 9, 1907, and acquitted July 28th. It was held by the defense that Orchard's testimony was not supported, that there was practically no other evidence, and it was charged, on the contrary, that there was a conspiracy of the Mine Owners, who hired Pinkertons and others as spies to join the Federation, incite to violence, and then accuse the members of the Federation, or in any way break up the organization. This portion of the evidence was, however, thrown out by the judge as not bearing on the case. Moyer was released on \$25,000 bail, but Pettibone detained, tho the labor view is that the case is ended, by the discovery of timber frauds involving, they claim, ex-Governor Steunenberg and Senator W. E. Borah, the leading prosecutor.

III. CAPITALISTIC VIEW

An anonymous writer in *The Outlook* for July 7, 1906—anonymous because he considers it unsafe to give his name—states the capitalistic view. He says in brief:

The following extract is from a speech of Edward Boyce, president of the Federation, delivered at Salt Lake on May 8, 1897. He said: "Every union should have a rifle club. I strongly advise you to provide every member with the latest improved rifle, which can be obtained from the factory at a nominal price." This appeal met with a prompt response,

Federation Outrages

for five days later, on May 13th, Federation men entered the building at Mullan, Idaho, where the arms and ammunition of the state militia were stored, and forty-six rifles and 10,000 cartridges were stolen. No arrests followed. The County Commissioners of the county (Federation sympathizers) petitioned the governor to disband the militia companies because they were "a continuous menace to the peace and good order of the county." Shortly afterward a foreman of the Helena-Frisco mill, who had offended the Federation, was taken from his bed by masked men and murdered. No arrests followed.

Some officials of the Western Federation pretended to be indignant at these crimes; and yet it was discovered that 250 rifles and 50,000 cartridges were ordered by the union, on union letterhead, and paid for by a draft signed by President Vincent St. John, who was conducting the strike under the direction of Federation officials. Nowhere will be found an instance where any man has ever been expelled or suspended from membership in the Federation for this act or any other similar act; and how is it conceivable that Vincent St. John's course was not approved by the Federation since he shortly after was again at the head of a local union, altho a fugitive from justice and under indictment for murder?

To pass over the strike in Cripple Creek in 1894, conducted by the Western Federation, which surpassed any previous record in its catalog of crime, there comes again, beginning with 1899, in Cripple Creek, a series of assaults, dynamiting, and murders, which affrights humanity. These crimes, where names, dates, and all attending circumstances can be submitted, are numbered by scores and scores. The victims were uniformly men who were giving or had given offense to the Federation. The woman in the home was notified that if the husband persisted in whatever course he might be following, opposed to the Federation, some day he would not come home. Dynamite was hung by strings down chimneys in a home where a lesson was to be taught to a man prominent in prosecuting members of this organization for stealing ore, and his home demolished by the explosion which followed the fire started by his wife in preparation for supper.

From the foregoing it would seem to be clear enough why evidence has been almost impossible to secure for the conviction of the perpetrators of this interminable series of crimes against life, property, and personal liberty. It is to be noted in addition that this organization did not stop with the violence already enumerated as part of its system of defense against the consequences of its course, but in addition systematically aimed to control all local civil officers.

As an instance of the thoroughness with which they dominate a local field, the list of civil officers in the Cripple Creek District, the scene of their last activity, shows not a single officer outside of membership in the Western Federation of Miners authorized to make arrests, serve writs, or institute any other legal process. This, moreover, is entirely in keeping with the fundamental law of the organization.

No just appreciation of the situation which confronted the men [mine-owners] in the mining districts of the West is possible without a recognition of the fact that in the contests

which have occurred they have fought for personal and business freedom in a sense which no other men have during this generation. The contest was not in any large measure industrial. It was for freedom of speech and of the press; for the protection of "the present system of government."

WHATELY, RICHARD: Was born in London, England, in 1787. He studied at Oriel College, Oxford; became a Fellow of Oriel in 1811; was Bampton Lecturer for 1822; rector of Halesworth, 1822-25; Professor of Political Economy at Oxford, 1830-31; and appointed Archbishop of Dublin in 1831. He was prominent for carrying out the principles of the Roman Catholic Relief Act; was for twenty years the leading member of the Irish National Board of Education. He is also associated with "Broad Church" divinity. Besides numerous philosophic and religious writings, he published *Lectures on Political Economy* in 1831.

WHISKY RING: This was a conspiracy between United States revenue collectors and distillers, originating in St. Louis in 1872, spreading into many Western cities, and attaining great political power. Its aim was to defraud the government in the collection of the tax on distilled spirits. The method of defrauding was by the secret shipment of whisky reported as stored. In 1874 a discrepancy was discovered between the returns and shipments of the Merchants' Exchange of St. Louis and those of the revenue officers. Benjamin H. Bristow, Secretary of the Treasury, unearthed the fraud. A general seizure in three cities was made May 10, 1875. Property aggregating \$3,500,000 in value was seized, and 238 persons were indicted. When the papers in these cases were laid before President Grant, he indorsed one of them with the injunction, "Let no guilty man escape." O. E. Babcock, President Grant's private secretary, was implicated, but tho acquitted, his guilt was generally conceded. No charge was ever made implicating Grant, but his tenacity in supporting his friends, even when their guilt was evident to others, made it easy for the ring to put many obstacles in Bristow's way. In one case, even, documents were tampered with. Many convictions were obtained, among others that of the chief clerk of the Treasury, Avery.

WHITE CROSS SOCIETY, THE: The White Cross movement was begun, publicly, Feb. 14, 1883, at Bishop-Auckland, England, by the Bishop of Durham, Miss Ellice Hopkins being present and bearing a prominent part. The work was taken up in this country by the Rev. B. F. De Costa, D.D., then rector of the Church of St. John the Evangelist, New York City, aided by his young men, during the winter of 1883-84, and spread throughout the United States.

The principal purposes of this organization are:

- (1) To urge upon men the obligation of personal purity;
- (2) to raise the tone of public opinion upon the subject of morality;
- (3) to secure proper legislation in connection with morality.

The member promises by the "help of God" (1) to treat all women with respect, and endeavor to protect them from wrong and degradation; (2) to endeavor to put down all indecent language and coarse jests; (3) to maintain the law of purity as equally binding upon men and women; (4) to endeavor to spread these principles among my companions, and to try and help my younger brothers; (5) to use every possible means to fulfil the command, "Keep thyself pure."

The methods of the White Cross are of a varied character. All aim to fulfil its declared object: "By the full presentation of those spiritual truths which form distinguishing characteristics of Christianity, and demonstrate its unalterable hostility to every form of impurity." The methods do not favor so much the creation of new machinery as utilizing that already existing. (See SOCIAL PURITY.)

WHITE RIBBONERS. See WOMAN'S CHRISTIAN TEMPERANCE UNION.

WICHERN, JOHANN HEINRICH: Founder of the Inner Mission (q. v.) in Germany; born April 21, 1808, in Hamburg. He was educated in his native city, and later visited the universities of Göttingen and Berlin to study theology. In 1832 he superintended a Sunday-school in Hamburg, and established the *Rauhe Haus* at Horn near by, the following year. The *Rauhe Haus* was a refuge for orphans, unemployed, poor, and otherwise needy people. In 1848 he suggested and formed the Central Committee for Inner Missions. In 1849 the Prussian Government entrusted him with the supervision of the 10,000 orphans of Upper Silesia—whose parents had died in a typhus epidemic—and in 1851 with the reform of jails and prisons. He was appointed a member of the highest ecclesiastical council in Prussia, 1859, and lived half the year in Berlin to attend to his numerous duties there in this new office. He took an active part in the organization of the society for sick and wounded soldiers, 1866 and 1870-71. Two years later he resigned his position in Berlin. Died 1891. He is author of "Die Mission der deutschen Evangelischen Kirche," 1849, 3d ed., 1889; editor of *Die Fliegenden Blätter aus dem Rauhen Hause*, 1844 until his death; *Der Dienst der Frauen in der Kirche*, 1858; *Die Behandlung der Sträflinge*.

WILBERFORCE, WILLIAM: Principal founder of the English Anti-Slavery Society; born at Hull, England, in 1759; educated under Methodist principles at Wimbledon and at St. John's College, Cambridge. In 1780 was elected to the House of Commons and became an intimate friend of Pitt, tho always voting independently. In 1787 he organized a society against vice; soon after was influenced by Clarkson toward his great lifework. In 1789 he first proposed the total abolition of the slave-trade, and in 1807 his bill was carried in the House of Commons and through the House of Lords. He still, however, labored for its victory in Parliament and without. In 1822 he shared in the founding of an antislavery society. He died in 1833, one month before the passage of the Emancipation Bill. (See SLAVERY.) He was interested in many other reforms, and published in 1797 "A Practical Review of the Prevailing Religious System of Professed Christians in the Higher and Middle Classes Contrasted with Real Christianity."

WILKIE, ALEX.: Member British Parliament, of Labor Party for Dundee; born 1850; educated at the public schools of Leven. He was apprenticed to a shipwright at Glasgow, became secretary of the Glasgow Shipwrights in the early seventies, later general secretary of the Associated Shipwrights' Society. He is a strong Federationist, and became chairman of the Norwich scheme in 1894, and a member of the Trade-Union Congress Committee which brought about a federation of the trades. He has held a number of offices in the union, and was a member of the Labor Representation Committee. He has visited America twice as representative of the Federation of Labor, at Detroit, 1889, and as a member of the Moseley Commission in 1902; is a Freemason, an Odd Fellow, and a member of the City Council. He was elected to Parliament 1906. Address: 8 Eldon Square, Newcastle-on-Tyne, England.

WILL, THOMAS ELMER: Economic writer and reformer; born 1861, Stone's Prairie, Ill.; earned money for education by teaching in country school; graduated Illinois Normal University, 1885; principal in village and city schools until 1888; student in University of Michigan, 1888-89; studied history and economics at Harvard; graduated as A.B. 1890. Specialized at Harvard in economic and social science, 1890-91. At end of year received his A.M.; 1891-93 was professor of history and political science in Lawrence University. During 1893-94 studied, lectured, and wrote in Boston. Was professor of economic science in Kansas Agricultural College, 1894-97, and 1897-99 was president of the college; 1900-1905 was in Chicago, at Ruskin College, Missouri, and in Wichita, Kan., teaching, lecturing, writing. In July, 1905, he entered the Census Office at Washington; and was transferred, April, 1906, to the editorial staff of the Forest Service in the Department of Agriculture, and since 1906 has been secretary of the American Forestry Association. Mr. Will, from 1890 to 1894, was a single taxpayer, but has gradually developed into socialistic views. Author: Several hundred magazine and newspaper articles and editorials relating to education, economics, politics, religion, and socialism. Address: 1311 G Street, N. W., Washington, D. C.

WILLARD, FRANCES ELIZABETH: Founder of Woman's Christian Temperance Union; born Churchville, N. Y., 1839. Her parents removed to Oberlin, Ohio, in 1841, where they were students in the college until 1846. They then went to Wisconsin and founded "Forest Home," near Janesville, going to Evanston in 1858. Here Miss Willard graduated from the Women's College. In 1861 she became a teacher, beginning in the public school of her own town and ending as professor of English composition in the university. In 1868 she traveled abroad for nearly two years and a half. On her return she was made president of the Women's College in Evanston. In 1874 she began her temperance work as president of the Chicago W. C. T. U. She was also made secretary of the Illinois W. C. T. U., and in November of that year, at the first convention of the National W. C. T. U., became its corresponding secretary.

In 1878 Miss Willard became chief editor of the Chicago *Daily Evening Post*. In that year she was elected president of the National W. C. T. U.

In 1880, accompanied by the Misses Gordon, Miss Willard made a tour of all the Southern states, introducing a knowledge of the spirit and method of the White Ribbon movement.

In 1883 Miss Willard and her secretary, Miss Anna Gordon, visited every state and territory in the United States and several Canadian provinces, holding the first temperance conventions ever called together in several of the Western territories. In 1883, on her return from California, proposed to the National W. C. T. U. a plan for organizing the World's W. C. T. U., which was accepted, and a polyglot petition to all governments was sent out. This petition received 3,000,000 signatures and attestations in fifty languages.

In 1885 she urged upon the National W. C. T. U. Convention the importance of adding a Department of Social Purity work to those already

formed, which was done, and she was placed at its head. Petitions were then circulated in all parts of the U. S., asking for the better protection of women, and much has been gained in the way of legislation. She was made a member of the General Conference of the Methodist Church, to which she had belonged since her girlhood, but a ruling of the bishops prevented any recognition of this election. Was editor-in-chief of the *Union Signal*, official organ of the World's and National W. C. T. U., and corresponding editor of Lady Henry Somerset's paper, *The Woman's Signal* (London).

Miss Willard was also one of the founders of the National and International Women's Council and first president of the council.

Miss Willard's devotion to the cause of woman's suffrage and the Labor movement is well known; was the author of the "home protection" movement, which means the ballot for women as a method of temperance work; also of the expressive phrase "The do-everything policy of the W. C. T. U." She has often stated her platform in these words: "No sectarianism in religion, no sectionalism in politics, no sex in citizenship!" In economics she called herself a Christian Socialist. She built up the largest organization of women in the world. Universally mourned, she died, 1898. Author: "Nineteen Beautiful Years"; "Hints and Helps for the W. C. T. U."; "Women and Temperance, How to Win"; "Woman in the Pulpit"; "A Classic Town"; "Glimpses of Fifty Years"; "A Young Journalist"; and collaborated in "A Great Mother, the History of St. Courageous."

ISABEL SOMERSET.

WILLIAMS, J.: Member British Parliament, of Labor Party for Gower, Glamorganshire; born in 1861, he began work in the collieries, and became chief agent of the Western District Miners' Association, and has been general secretary of the Amalgamated Society of the South Wales Colliery Workers since 1890. He was elected to Parliament in 1906 by the votes of the miners. Address: Miners' Association Offices, Swansea, Wales.

WILLIAMS, TALCOTT: Journalist; born 1849 at Abeih, in Turkey; educated at Phillips Academy, Andover, and Amherst College, class of 1873; served on staff of *New York World* 1873-77; Washington correspondent of *New York Sun*, 1877-79; editorial writer for *Springfield Republican* 1879-81. Since 1881, editorial writer for the *Philadelphia Press*. A frequent contributor to literary and philosophical journals, Mr. Williams has wielded a large and powerful influence as well in literature as real life. Two colleges and two universities have dignified him with a doctorate in letters—Amherst and Hobart, Western Reserve and Rochester. In matters economic and social, he declares himself a believer in free contract, free competition, and free labor, subject to such restrictions in regard to child-bearing and child life as are necessary to maintain at its highest efficiency the reproductive agencies of the community. Such a régime, he believes, has steadily tended to diffuse wealth, to improve the condition of those who labor, and to increase the joy, the dignity, and the promise of the general mass of the people. Address: 916 Pine Street, Philadelphia, Pa.

Temperance
Work

WILMS, DR. HEINRICH: Mayor of Posen; born 1866 at Huenshoven, province of the Rhine, Germany; educated at the public schools, the high school, and in 1885 passed the entrance examinations for college; then studied law in Heidelberg, Munich, and Bonn; received, in 1888, as "Referendar" to the court; in 1893 was made "Assessor," and was for some time a judge at the court of Cologne. Appointed mayor's assistant at Bonn in the year 1895. During the three years he occupied this position he worked particularly in aid of the poor, gained admission of women to the city's Poor Department, obtained for them the same rights and duties as the male attendants had and the district superintendents of the poor. This was the first instance in Germany where women were accorded equal rights with men in charities aid organizations, and, curiously enough, Bonn remains to this day the only place where women workers as compared with men are not in the great majority. Accepted in 1899 the same position in Düsseldorf, with a special assignment to the work of improving the wharves of the Rhine. During this appointment was also honorary director of the Düsseldorf Exposition of Industries and Trades. Dr. Wilms was elected Mayor of Posen in 1903. Address: Posen, Germany.

WILSHIRE, GAYLORD: Editor of *Wilshire's Magazine* (Socialist); born Cincinnati, Ohio, 1861; entered Harvard College 1881, but did not graduate; in 1884 went into gold-mining in California; founded in 1889 at Los Angeles a weekly Socialist paper, *The Nationalist*; in 1890 ran for Congress as a Socialist; in 1891 he was Socialist Party's candidate for Attorney-General of New York. Went to England, and in 1893 at Manchester became candidate for Parliament of the Social Democratic Federation. Returning to California, was again candidate to represent the cause of the Socialist Party in Congress. In 1900 he founded at Los Angeles *The Challenge*, a Socialist weekly; in 1901 he moved the paper to New York City. Here *The Challenge* was debarred from the United States mails on the ground that it was merely an organ for the advertising of ideas and ideas so essentially personal to the editor, that therefore *The Challenge* was purely an advertising magazine. Mr. Wilshire then moved the magazine to Toronto, Canada, changing the name to its present title, and from there sent it freely everywhere throughout the U. S. until 1904, when he returned with his magazine to New York City. While in Toronto he was candidate for the Canadian Parliament, and on returning to New York in 1904 was made the Socialist Party's candidate for Congress. Mr. Wilshire is now President of the Beaver National Bank of New York City. Address: 200 William Street, New York City.

WILSON, JOHN: Member British Parliament, of Labor Party for Mid Durham; born in 1837, he began work at the age of ten in Durham, later in American mines; and was instrumental in forming the Miners' Association in 1869; became its treasurer in 1882, financial secretary 1890, and corresponding secretary in 1896. He was a member of Parliament for Houghton-le-Spring division in 1885-86, and has been returned for Parliament by his present constituency continuously since 1895. In 1906 the miners, assisted by the Liberals, elected him again. Address: 1 North Road, Durham, England.

WILSON, JOSEPH HAVELOCK: Member British Parliament, of Labor Party for Middlesborough; born 1858 at Sunderland; he became a seaman, and founded the National Amalgamated Sailors' and Firemen's Union in 1887; was imprisoned during the Cardiff strike in 1891. He was elected to Parliament in 1906, but sat for his district from 1892-1900. The laborers with the assistance of the Liberals elected him. Address: Maritime Hall, West India Dock Road, London, E. England.

WILSON, WILLIAM TYSON: Member British Parliament, of Labor Party for West Houghton, S. E. Lancashire; elected 1906; born near Windermere, Westmoreland. He was apprenticed to a joiner and carpenter at Hawkeshead, and worked at the trade in Barrow, Bury, and Bolton. In 1877 he joined the trade society, and has since been in office almost continuously. Was a member of the executive council in 1893-95; became chairman in 1897, and been continued since. He was one of the founders of the Bolton Building Trades Federation, and assisted in the prevention of a lockout in the building trades 1899. He was chairman of the employees' committee which met the National Federation of the Master Builders' Reconciliation Boards for the building trades. In 1895 and since he has been instrumental in bringing about various conferences of his union with the master builders, the result of which was the establishment of conciliation boards and the effective prevention of strikes in the building trades. He has represented his union at several conferences of the Trade-Union Congresses, and those of the Engineering and Shipbuilding Trades Federations. His interests center chiefly in the organization of the skilled working men. Address: 248, Oxford Grove, Bolton, England.

WINKELBLECK, KARL GEORGE: German Socialist writer; born 1810 in Ensheim, near Mayence. He became a professor of chemistry, but in 1843, traveling to study technological subjects, he met in Norway a German artisan and became interested in what he heard and saw of the sufferings of the working classes. The result was his book, "Untersuchungen über der Organization der Arbeit oder System der Weltökonomie," 1851-55, written under pseudonym of Carl Marlo, and now recognized as one of the ablest statements of German socialism. He died in 1865.

WISE, HON. BERNHARD RINGRASE, K.C.: Some time State Attorney-General of New South Wales, Australia; born Sydney, Feb. 10, 1858; editor Rugby, Queen's College, Oxford; president of the Oxford Union and Athletic Club, 1880. Called to bar in England, 1883; appointed Queen's Counsel, 1898; elected to Legislature, New South Wales, 1887-89 and 1891-94; Attorney-General in Parkes Ministry and in Lyne government, 1899-1901. Took active part in free-trade movement and in movement for Australian Federal Union; member of the National Convention which framed Commonwealth Constitution, 1897-1898. Author of Bankruptcy Act and Industrial Arbitration Act. Identified with prison reform and founded the Discharged Prisoners' Aid Association. Author of "Industrial Freedom." Address: Australian Club, Sydney.

WOLFF, HENRY WILLIAM: Chairman of the International Cooperative Alliance; born Dec. 30, 1840, at Leeds, England. After being educated at a private school he studied for some years at the universities of Bonn and Heidelberg. Later he traveled extensively on the Continent in order to finish his education and to inquire into social and industrial conditions. On his return to England he advocated social reforms in his writings, and took a prominent part in the founding of the International Cooperative Alliance, which has extended its work over twenty-five countries. He believes that social betterment can be brought about by the breaking down of class distinctions, by leveling up by means of moral and educational influences, and by self-help. Author: "People's Banks—A Record of Social and Economic Success"; "Cooperative Banking—Its Principles and Its Practice"; "Agricultural Banks"; "People's Bank Manual"; "Village Banks"; "Cooperative Credit Banks"; "Employer's Liability—What Ought It to Be?" Address: Reform Club, London, S. W., England.

WOLOWSKI, LOUIS FRANÇOIS MICHEL RAYMOND: Social economist; born Warsaw, 1810. He studied in Paris, but took part in the Polish Revolution of 1830. He became professor of law in the Conservatoire des Arts and Métiers at Paris in 1839, and sat in the Constituent Assembly in 1848. His best-known works are: "De l'Organisation du Travail" (1843); "L'Or et l'Argent" (1870). Died at Gisors, France, in 1876.

WOMAN'S CHRISTIAN TEMPERANCE UNION: The National and the World's Unions are organizations of women for the protection of the home, the abolition of the liquor traffic, and the triumph of Christ's golden rule in custom and in law.

The National W. C. T. U. is the lineal descendant of the Woman's Temperance Crusade of 1873-74, when in fifty days the liquor traffic was swept out of 250 towns and villages. The logic of events soon forced the women to enlarge the circle of their work until it included "not only mental suasion for the man who thinks and moral suasion for the man who drinks, but legal suasion for the drunkard-maker and prison suasion for the statute-breaker." The National W. C. T. U. of the United States was organized Nov. 18, 19, and 20, 1874, in Cleveland, Ohio. It is organized in every state and territory in the nation, including the District of Columbia and Hawaii, and locally in about 10,000 towns and villages. There are 350,000 members and men are admitted as honorary members. The national motto is:

History "For God and Home and Native Land." The watchwords are: "Agitate, Educate, Organize." The badge is a small bow of white ribbon. The lines of work are: (1) Organization. (2) Preventive. (3) Educational. (4) Evangelistic. (5) Social. (6) Legal. Under these six heads are grouped forty departments, each one under the charge of a national superintendent. Following the suggestion of Miss Frances E. Willard, who was president from 1878 to 1898, the National W. C. T. U. worked for scientific temperance instruction in the public schools and secured mandatory laws for it in every state; and in the territories and the District of Columbia through congressional legislation. The W. C. T. U. has been the chief factor in state campaigns for statutory prohibition South as well as North,

and for constitutional amendments. It aided very materially in securing the anticean amendment to the army bill, which prohibits the sale of intoxicating liquors in all army posts. It keeps a superintendent of legislation in Washington during the entire session of Congress to look after reform bills. Congressman-elect Roberts, the polygamist, was prevented from taking his seat in the U. S. Congress by petitions and protests largely gathered by the W. C. T. U. It has been an important factor in the Smoot investigation and is creating public sentiment which it is believed will result in a national constitutional amendment prohibiting polygamy. It has obtained antigambling and anticigarette laws. It has secured many laws for the protection of women and girls, raising the age of protection for girls in every state but two, and securing the appointment of police matrons in nearly all the large cities of the U. S. It has created public sentiment in favor of equal suffrage, equal purity for both sexes, equal remuneration for work equally well done, equal educational, professional, and industrial opportunities for men and women. It has a bureau of scientific research, and sends authoritative statements from prominent physicians who are in favor of medical temperance to practitioners throughout the U. S.; and appeals to publishers of newspapers asking them to discontinue the advertising of alcoholic and other harmful proprietary medicines. It distributes millions of pages of literature every year and fills thousands of columns in the daily and weekly newspapers. The National W. C. T. U. publishes two papers: *The Union Signal*, its official organ, and *The Crusader Monthly*, for young people, and the department of Scientific Temperance Instruction.

The World's W. C. T. U., founded by Miss Frances E. Willard in about 1883, is organized in fifty nations with a total membership of about half a million. It is the largest society composed exclusively of women and conducted entirely by them. It has held seven conventions: Boston, Mass., in 1891; Chicago, Ill., in 1893; London, England, in 1895; Toronto, Canada, 1897; Edinburgh, Scotland, 1900; Geneva, Switzerland, in 1902, and Boston in 1906. The World's Union has circulated a "Polyglot Petition" in all parts of the world, asking the governments to do away with the manufacture of and traffic in alcoholic liquors and opium and the legalization of impurity. It is the largest petition ever presented on behalf of any object and the most international in its proposed reforms. It has been presented to the President of the U. S., to Queen Victoria, and the Governor-General of Canada.

The officers of the National W. C. T. U. are: President, Mrs. Lillian M. N. Stevens; vice-president at large, Miss Anna A. Gordon; corresponding secretary, Mrs. Susanna M. D. Fry; recording secretary, Mrs. Elizabeth Preston Anderson; assistant recording secretary, Mrs. Sara H. Hoge; treasurer, Mrs. Harriet W. Brand. The officers of the World's W. C. T. U. are: President, the Countess of Carlisle; vice-president at large, Mrs. Lillian M. N. Stevens; honorary secretaries, Miss Agnes E. Slack, Miss Anna A. Gordon; honorary treasurer, Mrs. Mary E. Sanderson.

Miss Frances E. Willard originated the "Do Everything Policy" of the W. C. T. U., and often stated her platform in these words: "No sectarianism in religion, no sectionalism in politics, no sex in citizenship."

DECLARATION OF PRINCIPLES

We believe in the coming of His Kingdom whose service is perfect freedom, because His laws, written in our members as well as in nature and in grace, are perfect, converting the soul.

We believe in the gospel of the Golden Rule, and that each man's habits of life should be an example safe and beneficent for every other man to follow.

We believe that God created both man and woman in His own image, and therefore we believe in one standard of purity for both men and women, and in the equal right of all to hold opinions and to express the same with equal freedom.

We believe in a living wage; in an eight-hour day; in courts of conciliation and arbitration; in justice as opposed to greed of gain; in "peace on earth and good-will to men."

We therefore formulate, and for ourselves adopt, the following pledge, asking our sisters and brothers of a common danger and a common hope, to make common cause with us, in working its reasonable and helpful precepts into the practise of every-day life.

I hereby solemnly promise, God helping me, to abstain from all distilled, fermented, and malt liquors, including wine, beer, and cider,¹ and to employ all proper means to discourage the use of and traffic in the same.

To confirm and enforce the rationale of this pledge, we declare our purpose to educate the young; to form a better public sentiment; to reform, so far as possible, by religious, ethical, and scientific means, the drinking classes; to seek the transforming power of divine grace for ourselves and all for whom we work, that they and we may wilfully transcend no law of pure and wholesome living; and finally, we pledge ourselves to labor and to pray that all these principles, founded upon the Gospel of Christ, may be worked out into the customs of society and the laws of the land.

In addition to the above the World's W. C. T. U. declares:

To this end we plead with all good women throughout Christendom to join with us heart and hand in the holy endeavor to protect and sanctify the home as that Temple of the Holy Spirit which, next to the human body itself, is dearest of all to our Creator, that womanhood and manhood in equal purity, equal personal liberty and peace, may climb to those blest heights where there shall be no more curse.

We ask all women like-minded with us in this sacred cause to wear the white ribbon as the badge of loyalty; to lift up their hearts with us to God at the noontide hour of prayer; to take as their motto, "For God and Home and Every Land," and to unite with us in allegiance to the foregoing declaration of principles and to the summary of our plans and purposes, as embodied in the preamble of our constitution adopted in Faneuil Hall, Boston, Mass., U. S. A., Nov. 11, 1891.

PREAMBLE

In the love of God and of humanity, we, representing the Christian women of the world, without distinction of race or color, band ourselves together with the solemn conviction that our united faith and works will, with God's blessing, prove healthful in creating a strong public sentiment in favor of personal purity of life, including total abstinence from the use of all narcotic poisons; the protection of the home by outlawing the traffic in alcoholic liquors, opium, tobacco, and impurity; the suppression by law of gambling and Sunday desecration; the enfranchisement of the women of all nations, and the establishment of courts of national and international arbitration which shall banish war from the world.

LILLIAN M. N. STEVENS.

WOMAN'S ECONOMIC POSITION IN GREAT BRITAIN:

In Great Britain, as in all industrial countries, the work of women is paid, on the whole, at a less rate than the work of men. It is, however, extremely difficult (for reasons to be examined presently) to estimate how far, if at all, this difference is a direct consequence of difference of sex. There exists, unquestionably, a vague general impression, amounting in many minds to almost the dimensions of a maxim, that the wages of a woman "need not be" so high as those of a man. For this impression custom and the current notion that a man's wages represent a family income while a woman's represent only a personal income are, no doubt, largely responsible.

Differences due to the prevalence of such feelings are not, in the strict sense of the word, *economic* differences.

¹ State and local constitutions can include the words "as a beverage," if desired.

There is, however, another and more important cause of difference between the payments of men and women, respectively; and this cause, though arising primarily from social custom, becomes, in its secondary developments, really economic. This cause is the fact that in most industries women expect to cease from working at marriage. They expect, that is to say—and in the majority of cases the expectation is fulfilled—to follow their callings for only a very few years; they expect to be, and generally they are, rather transient than permanent workers.

Now, transient workers, even altho they may be inherently equally efficient, are of less value to an employer than permanent ones. Every change of hands involves a slight temporary waste of power, nor can any worker, in a short period of work, attain to the higher levels of skill and experience. Moreover, when a worker expects to be employed for only a few years it is not, financially speaking, worth her while to spend a large proportion of those years in being trained or taught. A girl who enters the labor market at fifteen and looks forward to leaving it at twenty-two, is naturally disinclined to spend seven years in apprenticeship—as her brother may be disposed to do, who expects to follow his calling for forty years or more. The more transient worker, therefore, is also the less trained. Thus it comes about that the less skilled branches of industry generally fall into the hands of women, not because women are naturally less capable, but because the probable course of their lives renders them unwilling to undergo prolonged training. This sort of specialization it is which makes any valid comparison between the wages of men and women, as such, almost impossible. Competition between a man and a woman engaged in precisely similar work is exceedingly rare. Where, however, occasional instances occur the woman will, almost invariably, receive less remuneration, even at a piece-work rate. Miss Irwin, secretary of the Scottish Council for Women's Trades, reports having seen the wage-book of a master printer in Scotland who employed both men and women as compositors and who entered and calculated the work of both according to the same piece-work scale. After adding up the several totals, however, he performed, in the case of each woman, a little sum in subtraction and handed to her two thirds of the amount "booked" to her credit. In the same way, when an employer exchanges a man-clerk whose salary has probably been £2 a week, for a woman-clerk, he will probably offer to the latter 14s. or 15s., altho he will often admit that the woman does the same work quite as well and gives less trouble. Perhaps that last clause may be, in some degree, an explanation. Women, as workers, are exceedingly apt to "give less trouble"; that is, to endure, without much protest, very unsatisfactory conditions of labor. And this docility, again, is partly due to the habit of regarding industrial work as merely a temporary condition.

While it is practically impossible to measure the share of these various influences in determining the well-nigh universal inferiority of women's remuneration, one fact may be noted which seems to indicate that the expectation of marriage is one of the most powerful. This is the fact that in occupations not habitually given up on marriage the remuneration of women approximates far more nearly to that of men. In

Women Workers

the artistic and literary professions, indeed, payment varies not with the sex but with the individual. The same thing is true of the Lancashire cotton-weavers, who habitually continue to work after marriage. The Amalgamated Weavers' Association is a strong trade-union of men and women (about 80,000 women out of a total of about 120,000 members) and all the members are paid at the same piece-work rate.

Very different from the position of the highly skilled and well-organized women of Lancashire is that of the young unorganized workers in such a district as the East End of London. Young workers in the lowest departments of factory work are paid, not infrequently, as little as 5s. a week—a wage upon which it is entirely impossible for them to maintain themselves independently at any civilized level. The average wage of factory girls from fifteen to eighteen years old, in what are called the "unskilled" trades, appears to range from about 7s. to about 10s. per week. Workers over twenty years of age will generally earn rather more; but the woman in such trades who, not being a forewoman, receives as much as £1 per week is exceptional.

The payment of dressmakers seems somewhat higher; a "full-hand," in London, would receive 14s. and upward.

Female shop assistants (and also male shop assistants) generally "live in"; i. e., they are boarded and lodged on the premises of their employer. Their salaries and their hours, by which, of course, their salaries must be measured, vary greatly according to the character and standing of the shop in which they are engaged: £20, £25, or £30 per annum are very ordinary rates. To this nominal salary there will in many cases be additions, commissions on sales—especially of certain specified goods—being not uncommon. On the other hand, fines are frequently inflicted for every breach of an extensive code of rules; and in a good many houses the diet is so Spartan that the "young people" are often obliged to make additions to it at their own expense. In this calling the difference between the remuneration of men and of women is far less than in many others.

Among clerks, whose work appears to have no clear dividing line of sex, this difference is perhaps at its greatest. Instances are not infrequent of responsible posts being offered to thoroughly competent young women at the rate of 12s. to 14s. per week. In one such case the young woman was to be bookkeeper and cashier to a well-known and wealthy firm and many thousands of pounds would have passed through her hands in the year. Fourteen shillings per week was the payment allotted. No man would have been asked to undertake the work at less than 30s. a week. The reason of this great divergence is not very easy to fix; it seems probable, however, that clerkships and situations in restaurants, etc. (where also the attendants do not "live in"), attract a great number of girls living at home and partly maintained by relatives, that these girls, very foolishly, are content to accept what is called a "pocket-money wage," and that the competition of these parasitic workers determines a very low average of pay all round.

Domestic servants are relatively well paid, especially in London, where a general servant or a housemaid will receive from £18 to £25 a year, besides board and lodging; a parlor-maid, rather more; a good children's nurse, from £20 to £30.

A highly trained cook can command from £30 to £50—a salary higher than that of some resident teachers in boarding-schools. Altho domestic service is reported to occupy in London "about one third of the total unmarried women over fifteen," and altho it is by far the largest women's industry in the United Kingdom, the demand for competent servants is very much greater than the supply; and as the requirements in the way of skill grow continually higher, while the reluctance of workers to enter the calling does not apparently diminish, it seems likely that the discrepancy will be maintained and even become intensified. Eventually the pressure may probably be lightened by improved training on the one hand and on the other by a change in the methods of employment and an approximation of domestic service to the conditions of other industries that are found more acceptable to the workers.

Sick nursing, altho it has become a skilled calling with elaborate courses of training, with examinations and certificates, was, in the majority of cases, very ill paid until not very many years ago. In this instance the explanation lies partly in the idea that nursing the sick was rather a work of mercy than a means of livelihood and partly in the presence of middlemen who, while charging high fees to the public for the services of a trained nurse, paid very small salaries to the nurses. These middlemen were sometimes the authorities of hospitals who made money by hiring out their nurses and sometimes agencies admittedly commercial. Some years ago, however, nurses began to combine into agencies of their own, and this movement has steadily, tho not even yet very largely, raised the general average of their remuneration. There are probably few, if any, trained nurses, nowadays, who accept a salary of £25 per annum, with board and lodging when not "at a case." The minimum charge for the services of a trained nurse in a private house is generally two guineas (£2 2s.) per week besides board and lodging, so that a nurse who has a good connection and deals with her clients direct is decidedly better paid than any of the workers hitherto mentioned.

Education presents itself as a calling employing men and women in much the same kind of work. In the volume of statistics issued by the Board of

Education in 1906 are to be found two tables showing the salaries of certificated teachers in public elementary schools. Of 13,618 head masters the average yearly salary was £160 9s. 5d.; that of 14,348 assistant masters, £114 8s. 10d. Of 17,539 head mistresses the average salary was £109 13s. 2d., and that of 32,428 assistant mistresses, £83 11s. 3d.

No head mistress received as much as £350 per annum, and only 14 as much as £300; while 164 head masters received over £350 (4 of these £500 or over) and 129 received between £300 and £350. One head master and 16 head mistresses were paid less than £50 a year. Of assistants no woman attained a salary of £200 per annum and only 69 women a salary of £150 and over; while no less than 285 were paid less than £50 a year. The men assistants receiving less than £50 numbered only 4; while 17 received upward of £200, one of these receiving £400—or £50 a year more than the best paid head mistress. It should be said that these figures are two years old and that both men and women are probably receiving rather more, but the proportionate rates remain much the same.

In the secondary schools under the London County Council the lowest salary for a head master is £400, and the highest £800; the lowest

salary for a head mistress £300 and the highest £600. The salaries of assistant masters range from £150 to £350 a year; those of assistant mistresses from £120 to £250. Very similar differences prevail throughout all branches of the teaching profession.

In journalism, in the various arts (painting, acting, literature, etc.), these discrepancies disappear. Some branches are extremely unremunerative but not more unremunerative for women than for men. The prizes in journalism, it is true, belong to men; no woman has yet succeeded in being appointed as editor of a large newspaper; but on the other hand the most profitable novels published in England at the present day are probably those written by two women. It appears, therefore, on the whole that the comparative underpayment of women is due principally to the fact that women generally do not continue to pursue a definite calling after marriage. Of course women, like men, are liable, under a system of free competition, to be reduced to the barest subsistence level; but they are liable to this fate not as women but as workers happening to possess nothing in the nature of a monopoly.

Women also are more exposed than men to the competition of the parasitic worker, i. e., that of the partly supported worker who accepts less than a subsistence wage. This form of competition is often attributed to married women, but investigation seems to show that married women are particularly stout in resisting reductions. Married women, as an experienced employer has been heard to remark, know the value of money. It is rather young unmarried women who allow themselves to be paid at rates upon which they could not live, and especially young women of what is called in England the lower middle class, the daughters of clerks, of tradesmen in a small way of business, and of families whose weekly incomes are small but regular and not derived from manual labor. Among women teachers there is direct evidence that those who have some income of their own are firmer in demanding to be well paid than those who have no resource but their earnings—a paradox perfectly comprehensible after all, upon reflection.

That the Factory Acts have lowered the payment of women there is no evidence at all. A committee appointed by the British Association for the Advancement of Science investigated the point and came to this conclusion. What evidence there is points, indeed, rather in the other direction—as would naturally be supposed by any person who recognizes low wages as a direct result of unrestricted competition.

It appears probable that in trades not pursued by women after marriage there will always remain an average of payment lower than the general average payment of men's labor; but there is no reason in the nature of things why the difference should be a very great one; and there is very great reason indeed for hoping that the next ten years may bring a vast improvement in the general industrial training of women—a matter greatly neglected hitherto by parents and by public authorities. The lifting of the greatest possible number of women out of the unskilled and into the skilled class of workers is one of the best methods of diminishing the terribly severe competition that keeps so many working women in Great Britain on the brink of starvation.

WOMAN'S ECONOMIC POSITION IN THE UNITED STATES: Woman's work has changed with economic changes. Previous to the introduction of machine industry, woman played perhaps a more important part in economic production than to-day, but was not a wage-worker. Industry was carried on largely in the home, each family being largely self-sustaining, doing its own spinning, weaving, brewing, cheese and butter making. Woman played naturally a large part in this life, but as wife or daughter or as household maid, not as a wage-worker in the modern sense.

With the development of the factory system, however, this was changed. Production was taken from the home, and woman in the home was left to do only domestic work, to become the domestic drudge. To an extent, however, she followed industry into the factory. The textile factories of England were full of women brought in from the rural districts, or with children sometimes brought from the almshouses. They worked cheaper than men and replaced men.

Their pay was the cheapest, their surroundings the worst, the moral tone the lowest. This created such a prejudice against factories that when later factories were developed in New England, from 1815-30, women could only be induced to work in them by offer of higher pay. Partly for this reason, therefore, and in part because popular education was very much farther advanced in America than in industrial England, factory life in the U. S. started on a higher level than in England. Girls from American homes in factory towns and the surrounding villages worked in the factories and maintained, as shown by *The Lowell Offering*, a high level of character.

There was little opening, too, for women in other lines. Harriet Martineau, in 1840, found in America only seven employments open to women—teaching, needlework, keeping boarders, working in cotton-mills, in bookbinderies, type-setting, and household service.

But this gradually changed. The successes of American life developed a growing number of families whose daughters did not need to work for a living, and factory work became despised. Irish and other European and, later, French Canadian families came in to do factory work. On the other hand, growing ideals of woman's rights and woman's independence opened other spheres for women—the store, the office, the studio, and, later, the professions. Woman's admission to

Nineteenth Century

professional life was contingent upon her admission to institutions of higher education. In no respect has the century seen greater changes than in this. In the U. S. in 1803, of forty-eight academies or higher schools fitting for college in Massachusetts, only three were for girls, tho a few others admitted both girls and boys. The first female seminary was opened by the Moravians at Bethlehem, Pa., in 1749. The first female seminary to approach college rank was Mount Holyoke, opened at South Hadley, Mass., by Mary Lyon in 1836. Vassar College, the next, dates from 1865. In this movement the West led the East. Oberlin College was founded in 1833, open to both men and women. Harvard Annex, affiliated to Harvard University, was not opened till 1879.

This higher education led to professional life, tho in a few instances women entered professional careers in the U. S. at earlier dates. Mrs.

Women in Professions

Margaret Draper was connected with the *Massachusetts Gazette and News Letter* during the Revolutionary War. The first daily newspaper in the world is said to have been established and edited in London, Eng., by a woman, *The Daily Courant*, by Elizabeth Malet. In 1841 Mrs. Lydia Maria Child edited the *Anti-Slavery Standard*.

In medicine the pioneer names are Harriet K. Hunt, of Boston, who from 1822-72 practised medicine without a diploma, and, above all, Elizabeth Blackwell (q. v.), who, after a long struggle, received a diploma at Geneva, N. Y., in 1849. Mr. Gregory, of Boston, opened a so-called school of medicine for women in 1848, but the first adequate woman's medical institution was Miss Blackwell's New York Infirmary, chartered in 1854. Women from earliest times had been midwives and nurses; but the New England Hospital first announced the training of nurses in 1863. By 1886 there were twenty-nine training schools for nurses.

In law Mistress Brut seems to have practised in Baltimore in 1647. After her the first woman lawyer in the U. S. was Arabella A. Mansfield, of Mount Pleasant, Iowa, who was admitted to the bar in 1864. By 1879, women were allowed to plead before the Supreme Court of the U. S.

In the ministry, after the preaching of Anne Hutchinson, in Boston, in 1634, of Lucretia Mott (q. v.) among the Friends, and Anne Lee among the Shakers in 1770, no women seemed to have preached till recent years, tho among the Primitive Methodists and similar bodies women always exhorted. Rev. Antoinette Brown Blackwell seems to have been the first woman ordained in the U. S. (in 1852, in the Congregational Church). (For statistics of women's occupations, see article **OCCUPATIONS**.)

Such is, in brief, the general survey of woman's industrial professional position during the nineteenth century. Perhaps woman's more industrial advance during the century has not been in the professions, but in commerce, as saleswomen, clubs, typewriters, etc. Here the change has been almost revolutionary. We come now to consider her industrial position.

For the U. S., Mr. Carroll D. Wright has summarized the facts as to woman's work and wages in chap. xvi. of his "Industrial Evolution in the U. S."

In 1850 there were 225,298 female and 741,671 male employees in manufacturing industries in the U. S.—i. e., women furnished 23.30 per cent.

In 1890 there were 757,065 females, which was only 17.21 per cent of the employees. Thus, in manufacturing, women play a relatively less important part than formerly—a larger proportion of their work doubtless being done by machinery. On the other hand, the number of occupations open to women has largely increased; and, taking all bread-earning occupations, the proportion of women to men is steadily gaining.

Mr. Wright argues in the above-mentioned chapter that women are not replacing men, but that men are being freed for other occupations, and that women are in part replacing the children to-day employed to a smaller extent in manufactories than formerly,

Woman in Industry

their employment being prevented by factory laws. This view, however, is not held by all. Mr. Wright says that in 1870 114,628 children of both sexes were employed in manufacturing industries, and formed 5.58 per cent of all employees, while in 1890 there were only 120,885 children, or only 2.57 per cent of the total number. But even on this showing, the actual if not the relative number of children had increased, so that women can scarcely be said to have replaced children, while under article **CHILD LABOR** will be found very serious evidence to show that the census estimate of the number of children employed is very considerably too low. In some states and in some industries child labor has been limited by legislation; but it is exceedingly doubtful if this is true of all portions of the country and all manufacturing industries. It must be remembered, too, that Mr. Wright's statement is only of the manufacturing industries. Taking the great number of children now employed in stores, or who sell papers, run errands, etc., in the cities, child labor in the U. S. has probably not been lessened and women can by no means be said to have replaced children. Mr. Wright further argues that they have not displaced men, because by the census reports a larger proportion of the male population is reported as having occupations in 1890 than in 1870. But having an occupation is by no means synonymous, unfortunately, with having work at one's occupation, which point the census fails to touch. The growing problem of unemployment (q. v.), therefore, leaves us still to ask if women working at cheaper wages have not replaced men working at higher wages.

Women's present economic situation in the U. S. is very hard to epitomize. In general their entry in growing numbers, in all branches of industry, especially the commercial (as saleswomen, cash girls, type-writers, etc.), is among the signs of the times. (For details, see **OCCUPATIONS**, p. 843.) In professional life, as saleswomen, secretaries, department heads, and even typewriters and stenographers, some (tho relatively few) earn comparatively high wages. Wages for skilled stenographers are not unfrequently from \$15 to \$25. But the vast majority of women earn scarcely one third of this (\$5-\$8). Details of wages of women will in many manufacturing industries be found under **WAGES**. (For the lowest paid work, see **SWEATING SYSTEM**.) The following table gives the condition in a prosperous state:

WOMEN'S WAGES IN 1900 IN EIGHTY-SEVEN INDUSTRIES IN MASSACHUSETTS

17 per cent of the grown women and 4 per cent of the grown men received under \$5 a week.

16 per cent of the grown women and 4 per cent of the grown men received \$5 to \$6 a week.
 20 per cent of the grown women and 7 per cent of the grown men received \$6 to \$7 a week.
 15 per cent of the grown women and 10 per cent of the grown men received \$7 to \$8 a week.
 12 per cent of the grown women and 14 per cent of the grown men received \$8 to \$9 a week.
 9 per cent of the grown women and 16 per cent of the grown men received \$9 to \$10 a week.
 7 per cent of the grown women and 18 per cent of the grown men received \$10 to \$12 a week.
 3 per cent of the grown women and 14 per cent of the grown men received \$12 to \$15 a week.
 1 per cent of the grown women and 4 per cent of the grown men received \$15 to \$20 a week.

According to an Ohio report for 1901, 6,920 women in the three largest cities earned \$4.83 a week, worked 57½ hours, paid \$2.44 for board and lodging, and saved 14 cents, 1,606 people depending on them for support. Quoted in "Getting a Living," p. 480.

In New York City 130,000 women work in 39,000 factories, young girls among them working twelve or fourteen hours per day.

WOMAN'S MOVEMENT, THE, IN EUROPE:

The movement for the improvement of woman's legal, industrial, and social condition in Europe is somewhat more recent than that in the United States and Great Britain. It began in 1865-66 with the formation of the so-called *Letzte Verein*, a society of women modeled after the "National Association for Social Science" of Lord Shaftesbury, and was named after its founder and first president, Wilhelm A. Lette. This society gave the impetus to a review of all the various relations of women in the social body.

INDUSTRIAL

The most pressing need was industrial, and the first woman's societies had purely practical ends in view. As woman came to compete with man, she found that she was not sufficiently equipped from an educational and technical point of view. After education had been provided for her, she found that she was still handicapped owing to certain legal obstacles. The woman's movement had to pass through these three stages: industrial, educational, and legal. The struggle for industrial woman emancipation cannot be given here; only recent facts.

Agricultural and house industries have always been open to women; the latter are, indeed, the special field where they can assist their husbands or make provision for their children without neglecting their family duties too much. But the necessity of providing for themselves drove at first single women

Germany

and later married ones into the factories and professions. The rapid increase in Germany of women wage-earners may be seen from the fact that from 1882 to 1895 it rose from 3,959,995 to 4,853,880; that is, 893,885, or 22.6 per cent. The percentage of women among all wage-earners was 25.7 in 1895. Most of them were employed in agriculture and allied occupations, 2,745,840; clothing, 713,021; textile industries, 427,961; commerce, 299,829; hotels, inns, and restaurants, 261,450; foodstuffs, 140,333; or 94.5 per cent in all. Insurance, with 569, had the smallest number. Many women were independent in their occupations, 1,069,007; of these 608,168 had their own establishments with a number of employees. The independent women were mostly actresses, teachers, deaconesses, sisters of various orders, midwives, supervisors in asylums, matrons, nurses, etc. The

women wage-earners under sixteen years numbered 10,728; those over sixteen years, 4,843,152. Of the latter, 2,861,148, or 59.1 per cent, were single or divorced; 935,623, or 19.3 per cent, widowed; 1,046,381, or 21.6 per cent, married. The percentage of single women was largest among domestic servants, 95.5.

In 1899 women were employed in factories in Germany as follows: under 14 years, 2,911; 14-16 years, 98,664; 16-21 years, 297,387; over 21 years, 501,021. Textile industries gave employment to 393,739 of these total numbers.

Practically all occupations are now open to women in Germany, except the higher civil professions. Germany had in all 66,138 women teachers in 1895, against 151,825 men. The figures in 1882 were: women, 48,000; men, 128,000. Prussia had (1891) only 8,500 women teachers, or 11.9 per cent of the total teaching force in the elementary schools; these were, moreover, mostly sisters of Roman Catholic orders. Of all the teachers in elementary and middle schools there were 67,600 men, and 13,250 women, or 16.4 per cent—mostly in girls' schools. To this number must be added 7,000 male and 1,100 female supplementary teachers, e. g., gymnastics, cooking, etc. Women have, of course, charge of the departments of sewing, knitting, crocheting, etc. There were 39,500 of these teachers in Prussia. All Germany had (1895) 2,409 women in the railroad service, 498 in the postal and 7,628 in the telegraph service. Fifty women practised medicine in 1907, and one pharmacy.

Germany had, in addition to these regular wage-earners, 1,746,326 women who either give part of their time all the year round to work for wages, or worked at certain seasons only; 80 per cent of these women were found in agriculture in 1895. In 1907 Germany had 1,119,692 women workers in manufacturing establishments supervised by the State.

Austria had 4,304,581 women wage-earners in 1890, 50.8 per cent of whom were engaged in agricultural and allied occupations; 725,037 were employed in industries, trades, hotels and inns, supplying of foodstuffs, domestic service, mining, etc. About 20 per cent of the teachers in primary and grammar schools were women, chiefly sisters of Roman Catholic orders, and engaged principally in convent schools. The total number of women teachers in all schools was (1890) 22,988, against 53,895 men; in 1880: women, 15,000; men, 41,000.

Other Countries

France had (1891) 1,840,885 women wage-earners employed in agriculture and allied occupations; 1,427,322 were, moreover, engaged in various industries, trades, mining, etc.; and 571,000 in commerce. Paris has now a number of women coachmen. In the teaching profession the percentage of women is much larger than in Germany or Austria. In 1886 the women teachers numbered 67,000, as against 86,000 men; in 1891 the figures were 81,978 and 87,559, respectively. The women teachers were mostly in convent schools. This condition has changed greatly since 1905, when the latter were suppressed, but data are not obtainable.

Italy had in 1891 about 3,100,000 women engaged in agricultural pursuits; 1,993,567 in various industries, hotels, inns, domestic service, etc., in 1881. Of the latter number 1,196,743 were employed in textile industries, which seem to be monopolized by women, since their number

exceeds that of the men 8 to 9 times. In the teaching profession women exceed men in numbers, 46,887, against 32,908; or nearly 60 per cent of the total.

In Japan the number of women clerks has increased 800 per cent in 10 years.

Switzerland had in 1888 about 92,500 women employed in agriculture and similar occupations; 73,011 in factories of various kinds; 59,788 of the latter number were over 18 years old. In 1891 there were 3,108 women teachers, against 6,224 men in the primary and grammar schools; and 703 women in kindergartens. In the middle schools there were 192 women, as against 1,178 men, the former nearly all in girls' schools; in normal schools 70 women, as against 298 men. Geneva has a woman dentist since 1907, and a woman lawyer.

The wages of women are from one third to one half lower than those of men in all occupations in which the sexes compete. The reasons for this general condition may be found in the facts that woman entered the industrial struggle comparatively late; that she is more defenseless than man owing to a smaller ability for organization; and finally, that her needs, especially if single, are fewer than those of man, particularly if the latter is married.

The opening of trades and professions to women soon created a need and a demand for better educational facilities. These were technical, professional, and cultural.

In order to enable women to compete with men, particularly in occupations specially suitable to them, a number of so-called *Frauenarbeitschulen* were established. They are a sort of industrial schools for women. The branches taught are: sewing, dressmaking, knitting, needlework, crocheting, etc.; drawing, bookkeeping, correspondence, and commercial mathematics. The school at Reutlingen, Württemberg, is the oldest; it was established in 1868. Other similar schools soon sprang up; Württemberg had 19 in 1890 with 4,511 pupils; Bavaria, 26 with 2,252; Saxony, 11 with 1,081; Baden, 16 with 1,110. Prussia and the other German states have not been slow in adopting this system. France, Austria, Hungary, Italy, Denmark, Sweden, Norway, Finland—have numerous schools along these lines with the same curricula in the main. For nurses, deaconesses, teachers, and other vocations excellent technical schools have been established. The demand for special instruction, for instance, in nursing and allied branches, may be inferred from the fact that in 1895 Germany had 66,246 women who were engaged in vocations pertaining to hygiene, medicine, and nursing; Austria in 1890 had 14,662; Italy in 1881 had 15,204; France in 1891 had 17,737.

PROFESSIONAL

The medical profession is open to women in nearly all countries of Europe, but thus far the number of women physicians is small on the Continent. Russia had the largest number, 550 in 1887, as against 18,009 men. The profession of law is closed to them, except in a few countries.

Switzerland was the first country to do this in 1867 at Zurich. The women who availed themselves of this opportunity were, however, mostly foreigners, chiefly Russians. Gradually all the other Swiss universities followed the example of Zurich. In 1898-99 there were in all 937 women

at Swiss universities; 555 were matriculated, among whom 473 foreigners, and 382 auditors. According to studies they were divided as follows: medicine, 355; philosophical branches, 93; law, 7.

The university of Bern promoted Miss Fumarkin, Ph.D., Privat-Docent, to a professorship in 1907.

France: Paris opened its university to women in 1868; at first as auditors, later as regular students—principally in medical courses, but now in some others, e. g., art and literature. French universities had 871 women in 1898; 66 per cent of these were Frenchwomen. In 1907 France had 2,500 women students in her universities: 124 in law; 796 in medicine; 1,105 in philosophy. Mrs. Curie was appointed Docent at the Sorbonne.

Other countries soon followed: Sweden and Finland in 1870; Denmark, 1875; Italy, 1876; Belgium, 1880; Norway, 1884; Spain and Rumania, 1888; Greece, 1890; Hungary, 1895; Austria, 1896, as auditors, 1900 as matriculated students in medicine and pharmacy. The attendance has, however, been small, except in Finland.

Russia and Germany deserve special mention; the former, because women were admitted to medical lectures in 1876, and has established a special medical faculty for women in St. Petersburg in 1897; the latter because women have, as a rule, no legal status in universities. Baden admitted women at Heidelberg in 1891; at first as auditors, later for matriculation. Other German states followed. But they were admitted as auditors only to special courses, chiefly in medicine; they needed a special permit from the government, and the permission of the lecturer. In 1899 the Federal Council issued an order that women should be admitted to the practise of medicine and pharmacy, and that they should be permitted to matriculate in German universities. Nevertheless, many lecturers still refuse to admit them on the same footing as men. Coeducation is making good progress—in some *Real Schulen* there are 50 per cent girl students—and this must eventually react on the conservative attitude of the universities. At present the only solution seems to be the establishment of special medical courses for women as in Russia. In 1900-1 there were 1,029 women at German universities, 13 of whom received the doctorate.

Holland admits women to the courses and practise of pharmacy.

The cultural schools in Europe were needed for two reasons: (1) as a preliminary training, and (2) as a means to supply information and instruction on general lines. The last need arose first.

Cultural Development In order to meet it a number of German cities have established *Mädchen-Gymnasien*; that is, schools which combine the academy and college. Two of these, those at Berlin and Karlsruhe, have adopted the course of the corresponding schools for men and prepare for the universities; others follow a somewhat different course and give instruction more specially adapted to the cultural needs of women. Switzerland has coeducation in the *gymnasien*. Rome has established one for women.

According to the German civil code a woman is the equal of man as a private individual. She is allowed to own property, give bail, and be guardian; she may sue and be sued; and has full parental power over her legitimate children. She may take up nearly all occupations open to men; but she cannot be a judge or serve on a jury, or as

minister of religion. Practically the same rights and disabilities are accorded to her in all countries of Europe, except Turkey. In most parts of Germany and Austria women have the right of suffrage at communal elections, provided they own property and are single or widowed. In Sweden they may vote at provincial elections—if single and property-owners—and are eligible to offices in the poor relief departments, and, in Stockholm, to the school board. In Norway they may vote at school elections; in Finland at communal, municipal, and State. In Sweden, Finland, Rumania, and some cantons of Switzerland women may practise law; also in France since 1900. In nearly all countries they are admitted to the study and practise of medicine; but are confined to women and children in their practise. In Russia women physicians have the same chances with men in the appointment of positions at State hospitals and health departments. The legal disabilities of women are gradually removed in all countries on the Continent; e. g., they are allowed to organize and thus agitate more effectually for improving their conditions.

As a compensation for not having the ballot, and in recognition of their peculiar position, women are specially protected by the laws in certain respects, particularly when they are wage-earners. The federal laws of Germany of 1891 prescribe that women shall under no conditions work at night in mines; that a day's work in any industry shall not exceed 11 hours, and on Saturdays and days preceding holy days, 10 hours; that lunch hours must be 1 hour, and for mothers 1 hour and 30 minutes; that for two weeks before and four or six weeks after confinement they must not be employed; that in dangerous occupations special regulations shall be passed for their protection according to local needs. Germany has recently passed special laws against the employment of women as waiters in inns and certain hotels.

WOMAN'S POSITION IN HISTORY: In prehistoric times and among barbarous tribes, women have occasionally been honored more than in later periods. The savage queen has sometimes been recognized as the superior of the savage king. Women in the legendary or heroic period or Greek history occupy a distinctly higher place than in the classic period. The cause for this is undoubtedly that early in the history of man customs have not yet hardened into social laws, and the position accorded to women depended, therefore, less upon social ideas and more upon the character of women. All history shows the same. Women of beauty or of ability, therefore, can secure a comparatively high place.

Around woman, too, more than around man, develops the family and the home. (See FAMILY.) If society first formed around the mother, force was the first law, and woman was usually looked upon as a slave, and later as a slave or a toy. She was early exposed to all those revulsions of feeling that follow the gratification, among rude men, of the animal passion. Chastity on the part of women was at first to large extent a property

right. Men demanded it in their property; to far less extent was it considered a merit in themselves. Monetary customs show how far marriage has its basis in property considerations.

Greece was probably the first country to develop monogamy, and to place women on an established basis of honor and of love. The parting of Hector and Andromache, the fidelity of Penelope to Ulysses, the love of Alcestis dying for her husband, the filial piety of Antigone, the heroic death of Polyxena, the resignation of Iphigenia to her father, who would sacrifice her life to fulfil his vow, the joyous love of Nausicaa, are pictures of Grecian womanhood in the early age, which, Lecky says, "Rome and Christendom, chivalry and modern civilization, have neither eclipsed nor transcended." Yet the heroes of that age had concubines. Female captives were little respected. Woman was always regarded as the inferior of man.

Marriage was regarded in civic light as the means of producing citizens. Protected somewhat by the law, the Greek wife was by custom fettered exclusively to household circles.

The Greek *hetæra*, or courtesan, was, on the contrary, free to develop mind and body, and become the intellectual companion of man. Statesmen like Pericles and philosophers like Socrates honored the *hetæra* in public and in private. Says Lecky ("History of European Morals," vol. ii., chap. v.):

If we can imagine Ninon de l'Enclos at a time when the rank and splendor of Parisian society thronged her drawing-rooms, reckoning a Bossuet or a Fénelon among her followers—if we can imagine these prelates publicly advising her about the duties of her profession, and the means of attaching the affections of her lovers, we shall have conceived a relation scarcely more strange than that which existed between Socrates and the courtesan Theodota.

Courtezans were honored, too, in connection with religion. They were the voluptuous priestesses of Aphrodite. The form of Phryne, carved in gold, stood in the Temple of Apollo at Delphi. Schools of vice at Miletus, Tenedos, Lesbos, and Abydos were connected with the temples. In Pompeii a symbol of the male organ of generation seems commonly to have been stamped on bread as representing the sustainer of life. Nor must the sensuality of Greece and Rome be regarded as exceptional. (See PROSTITUTION.) Says Lecky (idem, chap. v.):

There has arisen in society a figure which is certainly the most mournful and in some respects the most awful upon which the eye of the moralist can dwell. That unhappy being whose very name is a shame to speak; who counterfeits with a cold heat the transports of affection, and submits herself as the passive instrument of lust; who is scorned and insulted as the vilest of her sex, and doomed for the most part to disease and abject wretchedness and an early death, appears in every age as the perpetual symbol of the degradation and the sinfulness of man. Herself the supreme type of vice, she is ultimately the efficient guardian of virtue. But for her the unchallenged purity of countless happy homes would be polluted, and not a few who, in the pride of their untempted chastity, think of her with an indignant shudder would have known the agony of remorse and despair. In that one degraded and ignoble form are concentrated the passions that might have filled the world with shame. She remains, while creeds and civilisations rise and fall, the eternal priestess of humanity, blasted for the sins of the people.

In Rome, woman, except in the very earliest period, was given more legal rights than in Greece. Marriage was regarded in law and in social ideals as a contract between equals. This in the earliest period was overridden, it is true, by the terrible powers given to the father of the family (see

Rome

Legal
Standing of
Women

Primitive
Times

FAMILY); but this was gradually modified, and the Roman and Stoic exaltation of the individual was extended to the wife. "*Ubi tu Caius, ego Caia*," the Roman wife could say. This conception of marriage as a contract between sovereign individuals led to easy divorce. The disintegration of marriage ties that set in is well known. (See FAMILY.)

The influence of Christianity on the legal and political status of woman has been much discussed. (See CHRISTIANITY AND SOCIAL REFORM; CHURCH AND SOCIAL REFORM.) Viewed from

Christianity the standpoint of modern ideas, the Pauline conception of woman is distinctly low. "Wives, submit yourselves unto your own husbands, as unto the Lord, for the husband is the head of the wife, even as Christ is the head of the Church, and He is the Savior of the body. Therefore as the Church is subject unto Christ, so let the wives be to their own husbands in everything" (Ephesians, chap. v. 22-24). But St. Paul immediately added, "Husbands, love your wives, even as Christ also loved the Church and gave Himself for it." Marriage by the Church fathers, and, to some extent, even in the pages of the New Testament, is conceived of as best a weakness, a legal concession to the flesh.

Nevertheless, the ideas of the early Church must be compared not with our ideas, but with those of that day, and the purity of the Christian family and the honor paid to woman is as light itself compared with the darkness of the impurity of the pagan world.

Says Origen: "There is not a Christian community which has not been exempted from a thousand vices and a thousand passions" (*Contra Celsum*). (For the influence of Christianity on the Roman legislation in regard to woman, see CHRISTIANITY AND SOCIAL REFORM.)

Coming to woman's position in the Middle Ages, it appears the result of the blending of many influences, the laws of the Roman Empire, the ideals of Christianity, the asceticism of the clergy, the traditions of the Germanic tribes, the romanticism of chivalry, and the lust of warlike

Middle Ages men. (See MIDDLE AGES; FAMILY; CHURCH AND SOCIAL REFORM; CHRISTIANITY AND SOCIAL REFORM.) The Germanic tribes honored woman, yet rather, as we have seen above, on the basis of savage equality than of legal status. Compared with the corruption of Rome, the purity of Germanic marriage struck Tacitus, and, through him and similar writers, has been much emphasized, but its purity did not begin to compare with that of early Christianity.

The influence of the Church in the Middle Ages was twofold. The influence of monasticism and asceticism on the ordinary life of woman was almost wholly bad. To conceive of marriage as sin was to give it over to sin. The terrible reactions of asceticism and the corruption developed by monasticism (*q. v.*) are well known. (See MIDDLE AGES.) Nevertheless, the nunneries did enable some women to escape the violence of the times and develop saintly lives.

In connection with this was the development of Mariolatry. The worship of the Virgin has probably more connection with the romantic and partly sensuous ideas of medieval chivalry than all writers are willing to admit. Yet no one can question its influence in part for good. Says Lecky:

It is also a striking illustration of the qualities which prove most attractive in women that one of whom we know nothing except her gentleness and her sorrow should have exercised a magnetic power upon the world incomparably greater than was exercised by the most majestic female patriots of paganism. Whatever may be thought of its theological propriety, there can be little doubt that the Catholic reverence for the Virgin has done much to elevate and purify the ideal of woman and to soften the manners of men.

Whence chivalry came no man wholly knows. It had a deep root in sensuality. No one can read the romances of the Middle Ages, the poetry of the minnesingers or the troubadours, without realizing this. Men cannot pay certain forms of respect to women without giving them, in their very adulation, the grossest insult. To praise a woman's weakness is to acknowledge it, and to show that one's ideal of womanhood is weak. To worship physical love is to confess to a low type of loving. The connection between chivalry and licentiousness is close. Nevertheless there was another root. Woman in the Middle Ages stood for the softening of war and violence and strife. When the knight knelt before his lady, he rose to a nobler manhood, and chivalry honored the source of the higher life.

The effect of the Protestant Reformation on the social status of woman was undoubtedly good, tho not an unmixed good. Its greatest effect in this respect was to condemn celibacy, the false praise of virginity, and the condemnation of marriage. Second only to this was its effect in freeing woman from subjection to the confessor and the priest. The sanctity of married life, the inviolability of the home, are almost distinctively Protestant conceptions. Undoubtedly, with these enormous strides forward, certain evils came in. The tendency to secularize the marriage relation has to some extent tended also to commercialize it and to increase divorce. (See DIVORCE.) However, of this secularizing and liberalizing tendency has come the modern movement toward woman's rights. It has, however, only developed in our own century. Milton, in his day, makes Eve say to Adam ("Paradise Lost," Book iv.):

God is the law, thou mine:
To know no more is woman's happiest knowledge and her praise.

Even Rousseau says:

Women are specially made to please men . . . all their education should be relative to men. To please them, be useful to them, to make themselves loved and honored by them, to bring them up when young, to take care of them when grown up, to counsel, to console them, to make their lives agreeable and pleasant—these in all ages have been the duties of women, and it is for these duties that they should be educated from infancy. . . . Being incapable of judging for themselves (as to religion) they ought to accept the decision of their fathers and their husbands like that of the Church ("Emile," ch. v.).

In 1797 Charles Fox said in a speech:

It has never been suggested in all the theories and projects of the most absurd speculation, that it would be advisable to expend the elective suffrage to the female sex.

This brings us, however, to modern times. See various articles.

WOMAN'S SUFFRAGE: We present first a general statement of the position of woman's suffrage in the world.

I. PRESENT STATUS

In the United States women possess suffrage upon equal terms with men at all elections in four

states: in Wyoming, established in 1869; in Colorado, 1893; in Utah, 1895; and in Idaho, 1896.

In Kansas women possess school suffrage, established in 1861, and municipal suffrage, 1887.

In nineteen additional states women possess school suffrage: in Michigan and Minnesota, established in 1875; in New Hampshire and Oregon, 1878; in Massachusetts, 1879; in New York and Vermont, 1880; in Nebraska, 1883; in Wisconsin, 1885; in Washington, 1886; in Arizona, Montana, New Jersey, North Dakota, and South Dakota, 1887; in Illinois, 1891; in Connecticut, 1893; in Ohio, 1894; in Oklahoma, 1904.

Two additional states permit women to vote upon the issuance of municipal bonds: Montana, established in 1887; Iowa, 1894.

Louisiana gave all women taxpayers the suffrage upon all questions of public expenditure in 1898.

Either full or fractional suffrage for women exists in twenty-six states.

There are in Australia three distinct classes of suffrage: municipal, parliamentary, and federal.

Women were given municipal suffrage in New South Wales in 1867; in Victoria, 1869; in West Australia, 1871; in New Zealand, 1877; in South Australia, 1880; in Tasmania, 1884.

Parliamentary suffrage was extended to women of New Zealand in 1893; in South Australia, 1895; in West Australia, 1900; in New South Wales, 1902; in Tasmania, 1903; in Queensland, 1905.

In 1902 the first Federal Parliament extended the federal suffrage to all women in Australia upon the same terms as men. All women in Australia, therefore, upon the same terms as men, enjoy full municipal and federal suffrage, and the women of West Australia, South Australia, and New South Wales possess all forms of suffrage. The women of Victoria do not possess the parliamentary suffrage. New Zealand is not federated, and hence there is no federal suffrage there; women and men vote upon equal terms in all elections.

In the Isle of Man and Pitcairn Island women have full suffrage. In England, Scotland, Ireland, and Wales women vote for all elective officers, except members of Parliament. In 1898 women engaged in commerce in France were given the right to vote for judges of the tribunals of commerce. In Sweden women vote for all elective officers, except representatives in Parliament; also, indirectly, for members of the House of Lords. In Norway all women, married or single, who receive a very small income, or whose husbands possess an income of the same amount, vote for all officers, including members of Parliament. In Russia women householders vote for all elective officers and on all local matters for which men are permitted to vote; in Finland, for elective officers, and nineteen women now have seats in Parliament. Property-holding women in Westphalia, Schleswig-Holstein, and Brunswick may vote by proxy at local elections, and for members of provisional diets. Women who are land proprietors may vote in Bohemia by proxy for members of the Imperial Parliament and the local diet. In Saxony women vote on the same terms as men; married women by proxy, a single woman directly. Women have municipal suffrage in Moravia by proxy. In Austria-Hungary they vote by proxy for elective officers. In Croatia and Dalmatia women vote at local elec-

tions in person. In Italy widows with property vote by proxy for members of Parliament. In Prussia women vote by proxy at elections and for members of provincial diets, and in Luxembourg for municipal officers and members of the legislature also. In Switzerland women real-estate owners have local suffrage in the canton of Bern. In Rumania women taxpayers have municipal suffrage by proxy.

CARRIE C. CATT,
*President of the International
Woman's Suffrage Alliance.*

(For United States and Great Britain, see special articles.)

In general the salient facts of the movement are set forth in *The North American Review* for September by Mrs. Ida Husted Harper, who is widely known as a historian and advocate of the cause. The storm center of the movement at the present moment, says Mrs. Harper, is Great Britain; its most conspicuous triumph has been in Finland, where nineteen women have seats in the National Parliament; and in the U. S. the conditions it has to overcome "are harder and more complicated than in any other country." The two most important events marking this question as a world movement, we are told, were the meetings of the International Council of Women in 1904 and the International Woman Suffrage Alliance in Copenhagen in 1906. The International Council of Women, which "comprizes seven or eight millions of the leading women in the various countries," has declared for strenuous efforts "to enable women to obtain the power of voting in all countries where a representative government exists." In fourteen countries the movement is organized and aggressive, and an international paper has been established for purposes of encouragement and propaganda. In New Zealand women have had the full franchise on exactly the same terms as men since 1893. In Australia since 1901 they have had the full federal suffrage and the right to sit in the National Parliament. Turning to Europe, Mrs. Harper points to the curious anomaly that in its two republics—France and Switzerland—"the cause of woman suffrage is more backward than in almost any of the other countries." In France, however, the "Catholics who have always stood inflexibly against giving political rights to women, are now saying that, if women had possess a vote, they would not have shown the indifference to the interests of the Church that men have, and Parliament would not have been able to bring about the separation of Church and State." In the Netherlands the movement "is well organized and advanced," and in Denmark it was greatly stimulated by the convention of the International Suffrage Alliance in Copenhagen a year ago. But in actual results Denmark "is far behind the other Scandinavian countries, behind even its own colony of Iceland." In Germany a leading Catholic paper has recently declared that the laws of the Church do not forbid the enfranchisement of women, and that social and economic development make it desirable, and the strong Socialist party in that country has formally espoused the cause. In Russia "the desire for a voice in the government is strong among all classes of women, but especially among the peasants."

The headquarters of the National American Woman's Suffrage Association is Warren, Ohio. See page 806.

II. ARGUMENTS FOR AND AGAINST WOMAN SUFFRAGE

(a) ARGUMENTS AGAINST IT

The arguments for woman suffrage are based partly upon the asserted natural rights of woman, partly upon the need of woman's influence in politics both to protect her own sex and to purify the increasingly important realm of political action; thirdly, upon the good results of woman suffrage where already tried. Upon the first point, says a leaflet published by the American Woman Suffrage Association:

The basic argument for woman suffrage is that women have as clear a title to the ballot as men have. It is urged that women are governed, but without their consent. From the Declaration of Independence is quoted: "Governments derive their just powers from the consent of the governed." In the support of the claim that the suffrage is a right of both sexes alike, the late George William Curtis said, in an address before the New York State Constitutional Convention of 1867:

"The rights which they [the fathers of the republic] declared to be inalienable are what are usually called natural as distinguished from political rights, but they are not limited by sex. A woman has the same right to her life, liberty, and property that a man has, and she has consequently the same right to an equality of protection that he has; and this, as I understand it, is what is meant by the phrase, 'the right of suffrage.' If I have a natural right to my life and liberty, I have the same right to everything that protects that life and liberty which any other man enjoys. I ask the same for every woman in this state.

"Our fathers answered the question of the best and surest protection of natural right by their famous phrase, 'the consent of the governed.' That is to say, since every man is born with equal rights, he is entitled to an equal protection of them with all other men; and, since government is that protection, right reason and experience alike demand that every person shall have a voice in the government upon perfectly equal and practical terms—that is, upon terms which are not necessarily insurmountable by any part of the people.

"I deny that the people of the State of New York can rightfully—that is, according to right reason and the principles of this government derived from it—permanently exclude any class of persons or any person whatever from a voice in the government, unless it can be clearly established that their participation in political power would be dangerous to the state."

Upon the second point, the need for woman suffrage, it is claimed that women cannot be adequately protected while men alone make the laws, and the denial of the franchise to women is denounced as a stigma degrading her to the same category with idiots, lunatics, and criminals. It is urged that woman's mind would be broadened and elevated by a study of public questions, and, further, that voting is the quietest, easiest, most dignified, and least conspicuous way of influencing public affairs. It is asserted that women need the ballot to protect their business interests and to acquire social and personal rights that are now denied them. It is claimed that woman suffrage would increase the strength of the home element in politics, secure the election of better men to office, and introduce higher moral standards into government.

(For evidence of the need of woman to protect her sex in legislation, see section 2 of this article, on "Woman's Present Legal Status." See also article AGE OF CONSENT.)

Concerning the results of woman suffrage, Miss Alice Stone Blackwell, editor of the *Woman's Journal* of Boston, writes the *Voice* of Nov. 9, 1893, as follows:

"In England Mr. Gladstone is on record as saying the women have exercised municipal suffrage 'without detriment and with great advantage.' Lady Randolph Churchill and the band of highly conservative Englishwomen who published a 'remonstrance' against granting parliamentary suffrage to women, a few years ago, were careful to say that they had no objection to municipal suffrage, and even thought its responsibilities had exerted a beneficial effect on the character of women.

"In the states where women have school suffrage only, the vote of women has generally been small, as the vote of men is always small wherever the school committee are chosen at a separate election; but the women who have voted have been almost without exception of the intelligent and respectable class.

"The statement has been widely circulated that the vote for the Boston women for the school board is falling off. At the last school election in Boston 4,000 more women voted than at the previous election; and the women's vote for the past five years has averaged more than six times what it averaged for the five years previous."

In Wyoming full suffrage was extended to women by the legislature of that territory in 1869. The results proved so satisfactory that the law was continued upon the statute-book for twenty years. In 1889, the constitutional convention elected to frame a constitution for the new state of Wyoming, and embodied a woman's suffrage clause in the constitution by a five-sixths vote. The constitution containing this woman's suffrage clause was submitted to the people (the people in this case meaning both men and women), and was ratified by a very large majority. Wyoming was admitted to the union with this clause in its constitution by a vote of 132 to 119 in the House of Representatives and a vote of twenty-nine to eighteen in the Senate. The House of the Wyoming legislature of 1893, just before adjournment, passed by a unanimous vote the following concurrent resolution:

"Be it resolved by the Second Legislature of the State of Wyoming:

"That the possession and exercise of suffrage by the women of Wyoming for the past quarter of a century has wrought no harm and has done great good in many ways; that it has largely aided in banishing crime, pauperism, and vice from this state, and that without any violent and oppressive legislation; that it has secured peaceful and orderly elections, good government, and a remarkable degree of civilization and public order; and we point with pride to the facts that after nearly twenty-five years of woman suffrage not one county in Wyoming has a poorhouse, that our jails are almost empty, and crime, except that committed by strangers in the state, is almost unknown; and as the result of experience we urge every civilized community on earth to enfranchise its women without delay.

"Resolved, That an authenticated copy of these resolutions be forwarded by the governor of the state to the legislature of every state and territory in this country, and to every legislative body in the world; and that we request the press throughout the civilized world to call the attention of their readers to these resolutions."

Every governor of Wyoming for more than twenty years has testified that much good has resulted from woman suffrage.

More recent experience bears out, according to the woman-suffrage believers, these good results. The first legislature elected in Colorado after the granting of woman suffrage raised the age of consent from fourteen to eighteen, and gave a married woman an equal voice with her husband in regard to children. At the last election in Denver the women are credited with defeating the saloon element. A correspondent of the *Congregationalist* writes from Sydney, South Australia, under date of May 9, 1896, that it is generally conceded there that woman suffrage has made parliamentary elections more orderly. It is true that nowhere has woman suffrage introduced startling changes, but this is neither to be expected nor desired.

OBJECTIONS TO WOMAN SUFFRAGE ANSWERED

The main objections to woman suffrage are that (1) women are physically disqualified from participation in the actual work of government; that they are unfitted for service in the fire and police departments and for the work of paving and lighting streets, building roads, and other forms of public property; (2) home duties would prevent woman, even if she were physically able, from participating in the administration of law, chiefly in such capacities as police officer and juror; (3) woman-suffrage would divide the husband and wife and leave the family no longer a social unit; (4) women are now virtually represented at the polls and in government.

To the first objection cited above the answer is

that what the voter needs is not personal knowledge of how to build sewers, construct aqueducts, run law courts, etc., but sufficient judgment and common sense to elect honest men to office to attend to these things. Women share in the results of these material things of government, and if the work has been badly performed, women suffer quite as much as the men, and therefore are entitled to a voice in the choosing of men who shall control these matters.

To the second objection answer is made that a woman need not cease to be domestic because she is also patriotic and takes an intelligent interest in public questions. Such a patriotic woman will be a more rational companion for her husband and a broader-minded mother for her children. Women owe the men of their families mental and spiritual companionship. In none of the states is the ability to bear arms or serve as juror or police officer regarded as a qualification for the suffrage. Not all male citizens, but only able-bodied male citizens, are subject to police duty. Women at home have as much time for voting as busy men, and they have more time for thought.

To the third objection reply is made that in matters of opinion and belief the unit must necessarily be the individual, not the family. The family ought to be a unit in affection, but it cannot always be a unit in opinion, and it rarely is so.

There is no country where the franchise is given to every head of a family and to no one else. No matter how many men over twenty-one years of age there may be in a household, each of them has a vote to represent his opinion. With the family as the suffrage unit, a widower who had lost his wife and children would be debarred from voting, because he is no longer the head of a family.

To the fifth objection, that women are represented already, the reply is, men cannot represent women, because they are unlike women. Women as a class have tasks, interests, and occupations which they alone can adequately represent. Men specially represent material interests; women will specially represent the interests of the home. The laws relating to the liquor traffic and to social purity, and the laws giving the husband power of disposing of his wife's property or children without her consent, and many other laws that might be cited, are evidence that the views of women are not represented in government. James Otis, one of the earliest American orators and a contemporary of Patrick Henry, said: "No such phrase as 'virtual representation' was ever known in law or constitution. It is altogether a subtlety and an illusion, wholly unfounded and absurd."

Other objections are: (1) politics are necessarily corrupting; (2) women would vote as their husbands or fathers do; (3) the best women will not vote; (4) most women do not want to vote; (5) woman suffrage would only double the vote without changing results; (6) woman suffrage would diminish respect for women.

The answers generally made to these objections are: (1) "If politics are necessarily corrupting," why not advise good men to quit voting? (2) Many women have no husbands and no living fathers. If they have and vote as these men do, there will be no quarrel; if they vote differently, then this objection falls to the ground. (3) Women who will not vote are not the best women. Women who are really conscientious will not shirk their duties when the time comes. (4) There is frequently an election toward which a

majority of the voters may be said to be indifferent. It has been shown by statistics that, except in years of presidential election, a majority of men in Massachusetts do not vote. (5) But the quality of the voters changes the quality of politics. A political party of men and women will not be the same as a party of men alone. (6) Voting is power. Power always commands respect. Women armed with the ballot will be stronger and more respected than ever before.

THE ARGUMENTS AGAINST WOMAN SUFFRAGE

The arguments against woman suffrage are as varied as those claimed for it. The main argument is that influence and power, even political influence and power, are and ought to be of more kinds than one. Voting is not the only means of political and social power. Quiet home influences are greater powers, even in politics, and in this realm woman is supreme. Men rule the outer world, women the inner. To drag women into the public arena is to weaken her influence at home and to violate that law of sex which nature has made, not man.

That women do not need to vote in order to secure proper legislation can be seen by the fact that, without the ballot, laws almost revolutionary have been enacted in favor of women in almost all countries within the last few years. In England and in many American states women are legally protected as much as men. Some injustices doubtless remain, but these are balanced by instances where women are more protected than men. Says Dr. Goldwin Smith, in "Essays on Questions of the Day":

The law regarding the property of married women has been so far reformed in the interests of the wife that, instead of being unduly favorable to the husband, it seems rather inspired by mistrust of him. The practice is still more so. It has become the custom to tie up a woman's property on marriage so that she shall not be able, even if she is so inclined, to make provision for her husband, in case he survives her, in old age, and save him from the necessity of receiving alms from his own children.

That the administration of the law has been unfavorable to women few will contend. In jury cases, at least, the difficulty is not for women to get justice against men, but for men to get justice against women.

Says Francis M. Scott, of New York:

The law of this state not only does not discriminate against woman in any respect, save that of voting, but actually affords to her many special privileges and immunities not enjoyed by men.

Undoubtedly laws could be improved for both men and women; but all cannot be done in a day, and the fact, which no one can deny, that enormous progress has recently been made in the legal status of women without woman suffrage shows that it is not necessary to such progress. Nor does woman suffrage necessarily bring great improvement. Even its friends do not claim that it has accomplished much. Says a tract, "Woman Suffrage Tested by its Fruits," published by the Massachusetts Association Opposed to the Extension of Suffrage to Woman:

In Wyoming full suffrage was given to women in 1869, and has been exercised by them ever since, at first under the territorial and later under the state form of government.

Wyoming enjoys the distinction of legalizing gambling. Licenses are granted for gambling just as they are for liquor selling, tho at a higher rate.

There is another section of the Wyoming statutes in which we fail to recognize the gentle and humanizing influence of women. It is section 875, and defines "excusable homicide" thus: "When committed by accident or misfortune in the heat of passion upon any sudden or sufficient provocation, or upon a sudden combat; provided that no undue advantage is taken.

nor any dangerous weapon used, and that the killing is not done in a cruel or unusual manner." There may be other states which pronounce killing "excusable" when done in "the heat of passion," provided it is not attended by unusual cruelty, but we do not recall them.

Of Colorado a writer in *The Outlook* for March 20, 1897, says woman suffrage has not purified politics; that the laws of the state as regards social purity and the rights of married women are not yet abreast of some of the Eastern states, while Wyoming is far behind Colorado.

The bad results of women's entry into the public arena are not so easily shown, because they consist mainly in the weakening of the home life and the quiet influence of women. But tho they cannot be shown, they may be, and many believe that they are, most marked and most threatening.

Feeling that there is a profound law of nature which enthrones woman in the home as men in political life, most women do not want the suffrage. Says the tract, "Tested by its Fruits":

How small is the proportion of women who really wish the ballot may be inferred from the "referendum" upon the question of municipal suffrage for women, taken in Massachusetts in 1895. The opportunity was given to women at that election, without any expense, or any trouble beyond that of registering and voting, to say whether they wanted municipal suffrage. Out of about 575,000 women entitled to vote, only 22,204 expressed a desire for the ballot. In Massachusetts, therefore, where the suffrage agitation has been as active as anywhere in the union, less than 4 per cent of the women want to vote. Assuming that this ratio holds generally, the suffrage proposition is that the ballot shall be forced upon the 96 per cent of indifferent or reluctant women, because the 4 per cent wish it.

Says Heloise Jamison, in the *Woman's Journal* for May, 1894:

Woman's place is in the forefront of life, that of the family and of the nation.

Woman's chance of saving, elevating, caring for them lies in staying with them behind the barrier that love has raised. Her chance of protecting herself and man is to go with him to the edge of battle, pray for him in the needs-most of public duty, be the incentive for his return, and the reward of his hard endeavor.

The destiny of the race is in her hands. God and man have placed it there, and it is in no spirit of self-praise or gratulation that she must carry on what is, after all these ages, but just begun. Every power in her must wake; she will decide what public work is consistent with this final duty and what is not. Chivalry is no myth of the Middle Ages, but a truth of the century about to dawn. The names of mother, wife, sister must not become the football of sentiment-mongers or of mistaken realists in thought. If the ballot would be a hindrance, we must have none of it.

WOMAN'S SUFFRAGE IN GREAT BRITAIN:

When the women of Great Britain obtain citizen rights, they will not be the first of their sex to enter into the political life of the nation. Disfranchisement on the ground of sex is a modern innovation which has crept into our constitution. In ancient Britain women were the political equals of men, having in time of war as well as in time of peace a full share of privileges and of burdens. In Saxon times, too, women were not debarred from taking part in the government of the country. Even after the Norman Conquest the political equality of the sexes was still maintained.

The public offices that women have held include those of queen, high sheriff, earl marshal, high constable, high steward. There have been

and still are peeresses in their own right and both peeresses and abbesses were formerly ad-

Early History

mitted to Parliament. There is conclusive historical proof that women formerly took part in the election of members of the House of Commons.

The seventeenth century saw a decline in the position and influence of women which coincided with the struggle between king and Commons. It is a curious fact that with the growth of democracy the political position of women tends to deteriorate. Those who believe that humanity rather than property is the true qualification for political rights are prone to consider humanity in this connection as comprizing only males. Nevertheless, there was no trace anywhere in our legislation of any exclusion of women from citizenship until the enactment of the Reform Bill in 1832.

The writings of Mary Wollstonecraft, John Stuart Mill, and others had caused a considerable section of the public to favor the political emancipation of women, and when next the task of reforming the franchise was seriously undertaken by Parliament, there was a vigorous demand that women should share the benefit of the proposed legislation. A numerous signed petition in favor of woman's suffrage was laid before Parliament by John Stuart Mill, and upon the introduction by the government of the Household Suffrage Bill, in 1867, he proposed an amendment for the inclusion of women in the measure. This amendment, tho it received substantial support, was defeated. Nevertheless, it seemed probable that the victory had in fact been won because the new franchise act, unlike the Reform Bill of 1832, employed not the words "male person," but the word "man." Lord Brougham's act, enacted in 1851, had provided that in all acts of Parliament, unless the contrary were expressly stated, words importing the masculine gender should include women. It was, therefore, generally believed that the word man applied to persons of either sex and that women had a legal claim to vote under the newly enacted Household Suffrage measure. The names of several thousand women were placed upon the register of parliamentary voters and the matter was brought before the law courts for decision. In support of the women's case it was argued, first, that sex is no legal disqualification for political rights, and, second, that the provisions of Lord Brougham's act applied, and that the word "man" must be taken to apply to women as well as to men. The judges gave an unfavorable decision and laid down in defiance of all historical fact that according to constitutional and common law women are incapable of exercising any public function. Thus it will be seen that the exclusion of women from political rights rests, not upon legislation, but upon judicial decision.

What is now claimed is that Parliament should set aside the legal decision of 1868 and reestablish the ancient order of things according to which a woman, if she possess the requisite qualification, had the same political rights as a man. In order to induce Parliament to take the desired action, woman's suffrage societies were organized in London, Manchester, and other towns.

As the agitation gained in strength the opposition to woman's suffrage was more plainly manifested. In 1875 a committee of peers, members of Parliament, and other influential men was organized for the purpose of opposing the claim

for the extension of the parliamentary franchise to women. Every time a bill came before the House of Commons urgent whips were issued calling upon opponents to attend and vote against the bill.

In 1884 a further extension of the franchise was proposed by the responsible government of the day. By this time the movement for the enfranchisement of women had so grown as to be far stronger than that which claimed the extension of the men's franchise. Notwithstanding this the government laid before the House of Commons a reform measure applying only to men. It was hoped, and with some reason, that an amendment to include women might be carried. Upon this Gladstone rose and said: "The cargo which the vessel carries is in our opinion a cargo as large as she can safely carry. With regard to the proposal to introduce woman's suffrage into this bill, I offer it the strongest opposition in my power and I must disclaim and renounce all responsibility for the measure should my honorable friend succeed in inducing the House to adopt it." Gladstone's threat was effective and the amendment was lost, the figures showing that if pledged supporters of the women's cause had been true to their convictions, the amendment, instead of being defeated, would have been carried by a majority of 72.

The woman suffragists of that day felt that they had made every possible effort and had failed, and it is perhaps not surprising that the movement was for many years under a cloud. The agitation suffered a further very serious check by the separation of women into different political camps. Foiled in their attempt to obtain their political rights, large numbers of women attached themselves to one or other of the men's parties.

The Primrose League admitted women to its ranks and in consequence grew very much in strength and importance. In 1887 was formed the Women's Liberal Federation.

A new Parliament was elected in 1886 containing 343 friends of woman's suffrage. Each session bills were introduced, but owing in some cases to the action of the government and in others to unforeseen accident, they made no progress.

During the recent Conservative administration the House approved the principle of woman's suffrage by the substantial majority of 114, but those in office neglected to act upon this favorable declaration, and in the following session the prime minister, A. J. Balfour, resigned office, the present Liberal government being at once formed. It was at this moment that the new militant agitation for woman's suffrage began. Six years earlier a breath of new life had come into the agitation. There were those who felt that there ought, in consequence of the growing political power of the working classes, to be some change in the methods of agitation. A vigorous campaign among working men and women was begun.

In 1903 some of those who had been most active in this work formed a society known as the Women's Social and Political Union.

The older societies for woman's suffrage had been at fault in making their appeal almost entirely to women of the prosperous classes. The Women's Social and Political Union soon discovered that it was equally unwise to make the woman's suffrage movement a purely working-class one. Accordingly this latter society has for

a long time past carried on its agitation among women of every social degree.

Immediately upon the formation of the new Liberal government, the Women's Social and Political Union determined to obtain a declaration as to whether the government intended to grant votes to women. At a great meeting in the Free Trade Hall, Sir Edward Grey, the Secretary for Foreign Affairs, was to expound the legislative program of the government. To this meeting went two members of the Women's Social and Political Union bent upon obtaining a reply to a question on woman's suffrage. The hall was crowded with representatives of Liberalism from all parts of Lancashire. As Sir Edward Grey proceeded with his address there were frequent interruptions from men seeking information on various matters. To these interruptions Sir Edward Grey did not fail to make a courteous reply in passing. The suffragists preferred to wait until his speech was concluded, when they at once rose to their feet and asked, "Will the Liberal government give women the vote?" In a moment the meeting

Present Movement

was in an uproar, some of the audience demanding that the speaker should reply to the question, others calling for the ejection of the two women. No reply was forthcoming and ultimately the suffragists were roughly removed from the hall. On the following morning the Manchester public was surprised to learn of the disturbance in the Free Trade Hall, and of the ejection and arrest of the two women suffragists. This incident was the first of many. During the following months at every meeting addressed by a member of the government, bands of women suffragists appeared for the purpose of demanding the political rights of their sex.

It was then resolved to request Sir Henry Campbell-Bannerman to receive a deputation, but this he declined to do. Refusing to allow their claim to be set aside in this cavalier manner, the union appointed a deputation to visit the prime minister's official residence in Downing Street and to wait there until an interview should be accorded. These instructions the deputation carried out. It was only the arrest of three of their number which caused them to cease their attempt to gain admittance. Finding the union to be so determined, Sir Henry Campbell-Bannerman yielded and announced that he would receive a deputation representing the Women's Social and Political Union and all the other societies having woman's suffrage for their object. A deputation representing nearly all the organized women of the country and numbering 450 persons assembled at the Foreign Office on May 19, 1906. They were accompanied to their destination by a large procession of women from various parts of London and the provinces. Having heard the statement made by the eight spokeswomen, Sir Henry Campbell-Bannerman expressed his complete sympathy with the woman's suffrage movement, but then went on to say that he could hold out no hope of legislation as his cabinet was not united on the question. Indignant, but more determined than ever, the members of the deputation proceeded to the public meetings which had been arranged and there announced their intention of compelling the government to act.

Before the session closed three other deputations were made in the precincts of the House of

mons, involving twenty further arrests. In the new session of 1907 the demand was again made that women should have immediate enfranchisement. Mrs. Fawcett and other members of the

Protests

older woman's suffrage movement made written application to Sir Henry Campbell-Bannerman to be allowed to plead their cause at the bar of the House of Commons. His response to this very constitutional action on their part was no more favorable than that which he had accorded to the more militant demonstrations by the Women's Social and Political Union. His excuse in refusing the application of Mrs. Fawcett and her colleagues was that no precedent existed for such a course as she proposed. The Women's Social and Political Union summoned a national convention of women to meet on the first day of the new session of Parliament. At this convention a resolution demanding the vote was carried unanimously and it was further resolved that the convention should march in procession to the House of Commons in order to convey the resolution to the prime minister. Before they had proceeded far on their journey, the processionists encountered a large body of police who attempted to break up their ranks. Undeterred by this opposition to their progress, the women made their way as best they could to the houses of Parliament, where they found awaiting them a band of mounted police. A scene of confusion ensued and several women, not all of them connected with the procession, were placed in serious danger of injury. Fifty-seven women were arrested and were sentenced to varying terms of imprisonment. The arrest of such a large number of women created something like a crisis, but the excitement was somewhat allayed by the introduction, by a follower of the government, of a Woman's Suffrage Bill. It was hoped that at a later stage the government might accord to this measure the support which would be necessary for its passage into law. Every section of the woman's suffrage movement was at once engaged in procuring support for the bill. The day for its discussion arrived. It was decided to make no militant demonstration, but to leave the House of Commons entirely free to discuss and vote upon the measure. There was a large attendance of members of Parliament, and the debate reached a higher level than that of any previous debate on the question. The prime minister attended, made a speech that was anything but encouraging, and then left the House. It was generally expected, however, that a favorable vote would be taken, and when, instead of being voted upon, the bill was talked out great disappointment was felt. The fate of this bill confirmed the members of the Women's Social and Political Union in their belief that nothing save vigorous opposition of every possible kind to the government will suffice to obtain legislation. It is by a combination of militant action and of opposition to the government at the elections that women may hope to obtain the vote. The demonstrations here described have brought down upon the heads of those responsible for them much condemnation and hostile criticism, but, what is far more important, they have destroyed the apathy which enveloped the woman's suffrage movement as with a cloud. They have brought to the notice of both men and women the fact that there is a movement for woman's suffrage. They have made people think

about the question, and once either men or women give thought to this matter they cannot resist the conclusion that woman's suffrage is both just and expedient. The election policy, tho perfectly orderly and constitutional in its nature, is even more resented, at least by practical politicians. The vehement way in which the tactics of opposition to the government are complained of by Liberals is a sign that such opposition must lead to success. The Women's Social and Political Union by its action at the elections is already something of a menace to the government. As the organization grows stronger it will become a greater menace still and the effort to force the government into granting woman's suffrage will be successful. It has taken half a century to teach women suffragists the lesson that political rights are never granted save in response to irresistible pressure. The means of bringing that pressure to bear has now been discovered, and there is little doubt that as a result of united and vigorous action the enfranchisement of the women of Great Britain will soon be an accomplished fact.

WOMAN SUFFRAGE IN THE UNITED STATES

The year 1848 is to the history of the struggle for woman's political rights what 1776 is to the story of the American Revolution. So strongly did the men and women who inaugurated the struggle for "woman's rights" feel this analogy that at the first convention held for the purpose they used the Declaration of Independence as the model and framework of their own declaration of principles.

But no great movement comes unprepared for or unheralded, and the Woman's Rights Convention of 1848 had had its John the Baptist crying in the wilderness of prejudice and injustice.

In 1790 Mary Wollstonecraft's "Vindication of the Rights of Women," published in London, attracted attention from liberal thinkers. Harriet Martineau, by her numerous writings upon political economy, demonstrated practically woman's ability to enter the realm of politics.

As early as 1820 Frances Wright, of Scotland, visited this country, and in 1828 lectured in many places,

striving to arouse the people to the danger threatening from the attempt to unite Church and State. All her influence was toward the recognition of woman equally with man in national affairs. Ernestine L. Rose, a brilliant and beautiful Polish woman, worked earnestly in this same direction.

Beginnings

It would be impossible to even mention here the host of women who, in the first half of this century, bore witness to their faith in the powers of their own sex to fill a wider "sphere" than the one appointed to them by the men of their day and generation. Emma Willard, in education; Elizabeth Blackwell, Clemence Lozier, Ann Preston, Hannah Longshore, Marie Zakrzewski, and Mary Putnam Jacobi, in medicine; Sarah and Angelina Grimke, Lydia Maria Child, Abby Kelley, Sarah Pugh, and Lucretia Mott, through their participation in the antislavery struggle; Margaret Fuller, in her literary work; Antoinette L. Brown, in the ministry; Susan B. Anthony, in the temperance work; Lucy Stone, at Oberlin, and in 1847 from the pulpit of her brother's church at Brookfield, Mass.—these all stood as pioneers making ready the way for the response to the call for the convention which made the first organized demand for "equality of rights for woman, social, religious, and political."

One other influence, and perhaps the greatest of all, leading directly to the calling of the Seneca Falls Convention, cannot be omitted here. This was the exclusion from the World's Anti-Slavery Convention, held in London in 1840, of the women sent there as delegates. A number of anti-slavery societies in this country elected women to represent them in the deliberations of that body; the English members were unprepared for this, and regarded it as an innovation not to be endured; a most exciting discussion filled the first day of the convention. Wendell Phillips, George Bradburn, also of Massachusetts, the venerable George Thompson, and Henry B. Stanton stood as the advocates of the rights of the women as delegates. The clergymen were, as a body, bitterly opposed to their admission. By an overwhelming majority, the World's (?) Anti-Slavery Convention refused to accept the women coming from Pennsylvania and Massachusetts fully credentialed as delegates, among whom were Lucretia Mott, Abby Kimber, Ann Green Phillips, Abby Southwick, Sarah Pugh, and Mary Grew.

Elizabeth Cady Stanton, who had accompanied her husband, Henry B. Stanton, to London for the convention, in conversation with Lucretia Mott about the iniquitous attitude of the assembly on the woman question, decided that men needed educating on this subject as much as upon the freedom of the black slaves, and they agreed that later they would have a convention to discuss the position and rights of women. This was the seed from which grew the meeting of which the following is the call, which appeared in the *Seneca County Courier* of July 14, 1848:

Woman's Rights Convention.—A convention to discuss the social, civil, and religious condition and rights of woman will be held in the Wesleyan Chapel, at Seneca Falls, N. Y., on Wednesday and Thursday, July 19, 20, current, commencing at ten o'clock A.M. During the first day the meeting will be exclusively for women, who are earnestly invited to attend. The public generally are invited to be present on the second day, when Lucretia Mott, of Philadelphia, and other ladies and gentlemen will address the convention.

This call was without signatures; it was issued by Lucretia Mott, Martha C. Wright (her sister), Elizabeth Cady Stanton, and Mary Ann McClintock. Altho not invited to the first day's sessions, men came, and in such numbers as made it impossible to exclude them. It was therefore decided to have a man preside, and James Mott took the chair. After a number of addresses, the new declaration of independence, entitled a Declara-

tion of Sentiments, was presented, and, after discussion and slight amendment, accepted. It followed exactly the form of the Declaration of 1776, substituting the words "all men" for "King George." As the original document related eighteen grievances, so that of the women contained exactly that number. Let me quote some of these:

The history of mankind is a history of repeated injuries and usurpations on the part of man toward woman, having in direct object the establishment of an absolute tyranny over her. To prove this, let facts be submitted to a candid world.

He has never permitted her to exercise her inalienable rights to the elective franchise.

He has compelled her to submit to laws in the formation of which she has had no voice.

He has withheld from her rights which are given to the most ignorant and degraded men—both natives and foreigners.

Having deprived her of this first right of a citizen, the elective franchise, thereby leaving her without representation in the halls of legislation, he has oppressed her on all sides.

He has made her, if married, in the eye of the law, civilly dead.

He has taken from her all right in property, even to the wages she earns.

After depriving her of all rights as a married woman, if single, and the owner of property, he has taxed her to support a government which recognizes her only when her property can be made profitable to it.

He has monopolized nearly all the profitable employments, and from those she is permitted to follow, she receives but a scanty remuneration. He closes against her all the avenues to wealth and distinction which he considers most honorable to himself. As a teacher of theology, medicine, or law she is not known.

He has denied her the facilities for obtaining a thorough education, all colleges being closed against her.

He allows her in Church, as well as State, but a subordinate position, claiming apostolic authority for her exclusion from the ministry, and, with some exceptions, from any public participation in the affairs of the Church.

Among the resolutions passed by the convention were the following, the only one which occasioned much discussion being that upon suffrage.

Resolved, That the same amount of virtue, delicacy, and refinement of behavior that is required of woman in the social state should also be required of man, and the same transgressions should be visited with equal severity on both man and woman.

Resolved, That it is the duty of the women of this country to secure to themselves their sacred right to the elective franchise.

Since 1848 the work of the advocates of woman suffrage has been to make good the claims set forth at Seneca Falls. To this end they have held conventions, organized associations all over the country, instituted courses of political study in their equal suffrage clubs, in preparation for their exercise of political functions, circulated petitions, sent out lecturers, worked to change laws through various state legislatures and in constitutional conventions, through amendments to state constitutions, and through their national associations, sought to secure from Congress the submission of an amendment to the national Constitution enfranchising the women of the U. S.

For many years this was carried forward by individuals working through other associations.

Finding the work for woman suffrage was hampered by its close association with

Associations the question of negro suffrage, and the fifteenth amendment to the national Constitution, those who felt strongly that the woman's hour had come and that she should not be made to wait until all sorts and conditions of men had first been admitted to the political kingdom, organized in May, 1869, in New York, the National Woman Suffrage Association, with Elizabeth Cady Stanton as president, her coworker, Susan B. Anthony, being on the official board. This organization bent its efforts chiefly toward national legislation to secure its object.

In November of the same year, in Cleveland, Ohio, there was formed the American Woman Suffrage Association, with Henry Ward Beecher president, and Lucy Stone and Henry B. Blackwell among its active workers. In 1889 these two bodies of workers joined and formed the National American Woman Suffrage Association, with Elizabeth Cady Stanton as its president, Susan B. Anthony vice-president at large, and Lucy Stone chairman of the executive committee.

In Dec., 1869, the Territorial Assembly of Wyoming enfranchised the women of that territory upon exactly the same terms as men, giving them the right to serve on juries and hold all territorial offices in the gift of the voters. In 1870 the grand and petit juries at Laramie were composed of both men and women, and the results were eminently satisfactory to all except the convicted criminals. The presiding judge, Chief Justice Howe, gave this as his opinion: "In eighteen years' experience I have never had as fair, candid, impartial, and able a jury in court as in this term in Albany County"; and Associate Justice Kingman said: "For twenty-five years it has been an anxious study with me, both on the bench and at the bar, how we are to prevent jury trials from degenerating into a perfect burlesque; and it has remained for Albany County to point out the remedy and demonstrate the cure for this threatened evil."

When, in 1890, Wyoming prepared her constitution for statehood, the women stood upon precisely the same political footing as the men, and

this attitude was maintained even when, in the U. S. Congress, opposition was made to her admission as a state unless the men were willing to yield the point and leave Wyoming's women disfranchised.

Wyoming is, therefore, the first true republic, the first star upon the woman-suffrage flag.

In 1893 Colorado enfranchised her women by a legislative enactment ratified at the polls, at which election the majority in favor of woman suffrage was 6,000. The women there have not been slow to use their newly acquired opportunity and have already become a power in public affairs. In the elections this spring in Denver (1897) they have cooperated successfully with the organizations struggling heretofore unsuccessfully for a better city government, and have won a notable victory over the gambling and saloon element which has had control there. That there has been no rush for office by the women is shown by the fact that the women's organizations which helped so effectively to win this victory for law and order asked for not a single name of a woman upon the list of nominations made by them in joint session with the men's organization.

The women of Utah have now the full franchise, secured to them in the constitution with which Utah came in as a state in 1896. As early as 1870 they had been enfranchised by the territorial legislature, but were disfranchised by Congress (Edmunds Bill) in 1887. This was done as a blow to polygamy; but it was questionable justice to disfranchise all the women of the territory.

Idaho, by an amendment to its constitution, passed in Nov., 1896, gave its women the ballot on the same terms with the men of the state.

Kansas women received the municipal suffrage by legislative enactment in 1887; this, of course, does not enfranchise all the women of that state,

as those outside of the cities cannot vote except upon certain elective trusteeships and upon school bonds and appropriations. Thousands of the Kansas women vote in the cities, and there have been fourteen women elected as mayors of small cities, and at one time two such municipalities boasted their entire City Council as made up of women, with a woman mayor to cooperate with them.

In nineteen states and two territories women vote for all trustees and directors where elective, which in most cases include school directors.

In Kentucky women can vote on school appropriations and bonds, provided they live in the country districts and are either widows or spinsters.

On this question of appropriations women vote (in addition to Kentucky, on conditions named above) on the same conditions as the men in Iowa, Kansas, Michigan, Minnesota, Nebraska, New Jersey (the only vote they have there), North Dakota, and Vermont.

In Louisiana and Montana they vote as to public improvements if they are taxpayers.

Among the results of the struggle of the last fifty years for the enfranchisement of women may fairly be claimed the great improvement in her legal status (see article WOMAN'S RIGHTS), a marked change in morals looking toward the same standard for man and woman, her admission to most of the great institutions of learning, and to the professions and business life. In many cases these advantages, where they involved legislation to bring them about, were given as compromises to women asking enfranchisement, by men unwilling to grant rights, but anxious to quiet the demands for that right which, once gained and exercised, will guarantee to its possessors all other rights which may come through law.

RACHEL FOSTER AVERY.

For recent facts, see WOMAN'S SUFFRAGE on page 1295.

WOMEN'S TRADE-UNIONS (IN GREAT BRITAIN): The object of trade-unionism, broadly stated, is to raise wages and improve conditions of industry by collective action. The improvement of conditions has been largely relegated to the State; factory and workshop laws deal with the conditions of the work-place, but State regulations only touch wages incidentally, and their regulation rests with the laws of the trade. Apart from its effect on wages, the effect of corporate action may have remarkable educational results on the members of trade-unions in widening their outlook, interesting them in the administration of their affairs, and in social questions.

It was at the beginning of the eighteenth century that we first hear of trade-unions, as we now understand them. Prior to that time there was a good deal of oppression, but the workers never appear to have been able to maintain any lasting combination against it, till, in the eighteenth century, we hear of the action taken

by the tailors, weavers, and various other classes of workers to protect themselves. At the beginning of the eighteenth century the conditions of work were changing, for it was becoming differentiated, and classes of workers were growing up who were only able to undertake a certain share in the production of the finished goods. Cutters, sewers, and

Limited Suffrage

Where Adopted

Beginnings

other special classes of workers were needed to carry on tailoring, and among the weavers some carded and others wove, while the material in both cases belonged to an employer. Therefore the work was being carried out by men the majority of whom could never hope to rise to be employers, who owned nothing but their skill, and whose interests were the same as those of all the other employees in the shop. Here, therefore, we get all the essential elements for a trade-union, in the existence of a permanent wage-earning class in a trade sufficiently skilled to render the workers intelligent and alive to their own interests. The resort of these early trade-unions for the redress of their grievances was always to the law; they did not attempt to keep up their wages by their unions, but used their organization to get the laws put into force; a comparatively easy step, when the government considered that it was their business to obtain for the workers a "convenient proportion of their wages," and when king and House of Commons appear to have held on these questions the workers' "brief."

It is dull to the modern trade-union official, who recognizes the value of machinery and welcomes invention, to find the government itself prohibiting the use of the gig mill at the workers' instance. But the tide of invention and all the conditions of industrial change were not to be kept back by laws, and tho as late as 1756 the Gloucestershire weavers obtained a table and scheme of wages by which their piece-work prices were to be settled by the justices, the act was one of the last of this description which was passed. Nor was this scheme of long existence, for before a year was gone it was repealed, in spite of the workers' struggle to retain it, by the influence of the employers. Henceforth the workers petitioned Parliament in vain, for tho the government agreed with them that their standard of life was lowered, while the production of their labor was enormously increased, they saw no way out of the difficulty, and amid universal discontent and frequent outbreaks, the situation developed till the beginning of the last century. After 1800 the old policy was entirely reversed, the laws giving powers to fix wages were repealed, the laws against combinations enforced, and the individualist school of *laissez-faire* ruled supreme.

For many years there was much oppression and suffering, imprisonment and heavy penalties were inflicted on the workers' leaders whenever trade-unionism showed itself, and the organizations at this date existed rather as secret societies, with quaint oaths and strange mysteries. Meanwhile, however, the division between labor and capital was becoming complete, a "horizontal cleavage" which created a national wage-earning class was taking place, and we owe the modern trade-union movement, with its identification of the interests of the workers as a class, to the persecution of trade-unionists, which did not cease till long after the laws against combinations had been repealed, for the individualist school died hard.

What part had women played in the vicissitudes and development of the trade-unionist movement? A very small one, tho it is interesting to find that in 1827, when, after the repeal of the Combination Laws, the Grand General Union of the United Kingdom was being started by the cotton-spinners, the women and girls were urged by them to form separate organizations.

The organizations did not last; but it is appropriate that what seems to be one of the earliest indications of women's trade-unions should be found in a trade which on the wiser lines of united enrolment includes now in its membership two thirds of the organized women of England.

The industrial interests of men and women are identical, and the present status of women's organization is, we are convinced, due to the recognition of this fact. About 100,000 women are members of the Lancashire organizations, and none are conducted with more wisdom or statesmanship.

The results are what we should anticipate. Wages are at a far higher average than is usual in trades where women are largely employed; hours and conditions in the cotton trade are notoriously above the average; the settlement of disputes is, as a rule, by the deliberation of the officials of the opposing organizations of masters and men, rather than by the rough-and-ready method of a strike. We have in Lancashire the champion women's unions of the world.

The same results have not yet been achieved outside Lancashire. The total of organized women numbers about 140,000, and of these the 50,000 not already accounted for are in scattered unions all over the country, not massed in one district or trade, and as the membership of some of them is very small, numbering even as few as fifty persons, they cannot be named with the

Results

great and stable Lancashire organizations. Apart from Lancashire the textile organizations of Yorkshire, and even of Scotland, are comparatively weak; and the same may be said of the textile center in Belfast.

During 1906 a remarkable revival has taken place in Scotland and in Belfast. A lockout in Dundee has resulted in a trade-union of 5,000 members, and struggles in Paisley, Brechin, and elsewhere are awakening the dormant interest in trade-unionism, while in Belfast a lockout of 15,000 operatives has also had as its result the increase of the textile unions there.

As the result of long experience, the W. T. U. League advocates and adopts the policy of organizing the women with the men in trade-unions, or where joint organization is impossible, in closely affiliated organizations. There are, however, some examples in which a women's union has been successful. Leaving the textile trade and coming to those miscellaneous trades in which women are employed, upholstering provides us with an example of a successful union of purely female membership, for in this trade in Liverpool the women have gained a rise of 2s. a week through their organization. The London Union of Women Cigarmakers, which forms an organization closely affiliated with the men's union, tho not an integral part of it, furnishes another example; as does the Leicester Cigarmakers' Union, containing about two thirds of the number of the trade in the district, of which two thirds half are women. In the Cigarmakers' Union the trade feeling is so strong that a complete system of boycott is carried out by the women, and non-unionists are not tolerated by them in their workrooms—a newcomer and non-unionist must join the union or relinquish her work. The felt hatters have opened their ranks to women, and have a considerable female membership. There has been a

plucky attempt both throughout the boot and shoe trade, and by the men officials in the tailoring and in the clothiers' trades, to bring the women workers into line with the men. This has not yet been very successful, tho there is a good branch of the first in Leicester.

It is clear that 140,000 women trade-unionists out of 5,000,000 available for organization is not a large proportion. It is, however, worthy of note that at the first Trade Congress at Sheffield in 1866 110,000 men only were represented, and the organization of women dates from a later date than that of men. The difficulties in the way of organization of women are great. Permanency in wage-earning is held to be a first essential for successful trade organization, and marriage, which frequently takes women out of the labor market, militates against this permanency so far as women are concerned. There has nevertheless been remarkable progress in trade-unionism for women during the last few years. The skilled and educated worker, telephonists, general post-office employees, shop assistants, telegraphists, are organizing. The telephonists' organization numbers 1,500, which is 75 per cent of the total available in London, and 100 per cent in some of the big centers, such as Manchester. More than two thirds of the possible female members in the major establishment of the general post-office have been enrolled, while the shop assistants' female membership is over 15,000. This forward movement among the educated and skilled women employees will have a great effect in consolidating the whole movement and giving it permanent stability.

The women to whom the work of trade organization has owed most in England in the past are Mrs. Paterson, the founder of the Women's Trade-Union League, and Lady Dilke, its devoted supporter and finally its chairman. Other strong personalities have been those of Mrs. H. J. Tennant, formerly superintending woman her Majesty's inspector of factories, and the League treasurer, Mrs. Marland Brodie, a textile worker and League organizer. At present magnificent organizing work is being done by the League secretary, Miss Macarthur. Its debt to men trade-unionists, particularly in the textile trade, is very great.

GERTRUDE M. TUCKWELL,

Chairman Women's Trade-Union League.

C., London.

WOMEN IN TRADE-UNIONS (IN THE UNITED STATES): The presence of women wage-workers in the trade-unions of the U. S. is a fact of very recent history; indeed, it is only within the last six or eight years that they have been organized in any considerable numbers. It is true that from the earliest days of American factory industry women have at times gone out on strikes, following the leadership of their men associates, or acting independently upon their own initiative and on account of their own grievances; but they have had almost no part in the successive organized efforts of wage-workers to obtain a larger share of the benefits of advancing

civilization. This fact is not hard to understand. The earlier labor agitations were largely political, both in aims and methods, and quite beyond the factory girl's range of interest, even tho she was a New England schoolmistress. Moreover, before industry had been completely taken out of the household, and before the real social significance of the factory system was recognized, women even more generally than at present looked upon wage-earning work as a temporary occupation, and interested themselves in ways of escape from it, rather than in means of improving its conditions. Their indifference to the purposes of the Labor movement was strengthened

History

by the hostile attitude of unionists toward female competitors in the factory and the shop. This opposition has given way, as the men have come to recognize that women are a permanent factor in the present system of industry, and that their competition is much less dangerous when they are brought into the unions and made a definite and controllable element in the labor problem. A new and enlightened policy in regard to women workers was part of a very liberal and aggressive program adopted by the labor organizations about 1890. From that time on, for several years, a very significant trade-union development took place, consisting in the association of local bodies to form national unions, in the growth in numbers and influence of the American Federation of Labor, and in the successful agitations carried on by these societies through their organizers. The movement, checked by the depression of 1894, soon regained strength, and by 1900 was going forward by leaps and bounds. In the later period a large number of women were brought into the unions. Indeed, upon the whole, the organization of women workers has been a subsidiary part of the union program, forced upon the men's societies by the necessities of the situation.

The American labor organizations of which wage-earning women are a part fall into four groups of widely differing importance. In the first class are the national and so-called international unions, which form the chief elements of the American Federation of Labor. The membership of these bodies is organized into local unions, which have a large degree of autonomy. The second group consists of those local trade and federal unions which are directly connected with the federation. They are made up of wage-earners in trades for which there is no national organization, or of employees in various industries who cannot be gathered into trade locals because of lack of numbers. To a third class belong those unions, fairly numerous in the Eastern states, which have no national or federal connections. The warring branches of the declining Knights of Labor form the fourth group. The last three classes are of comparatively little significance in relation to the subject in hand, whether judged by numbers, or by the part women have played in their history. For this reason, and because it is impossible to obtain detailed information concerning them, this article is confined to a consideration of the national trade organizations, which are the main factors in the American Federation of Labor.

These unions may be considered in three groups, the basis of classification being the numbers and relative importance of women in the trades; for these facts vitally affect the strength

of the union, the activity of women in its management, and explain many of the details of its history. In the first class are

Groups

those organizations having jurisdiction over industries in which women are but a small part of the total number of wage-workers, and usually perform unskilled processes. Owing to their relative unimportance union men have not considered it a profitable policy to spend great energy in bringing them into their organizations. The unions of the Telegraphers, the Potters, the Bakery and Confectionery Workers, the Meat Cutters and Butchers, and the Hotel and Restaurant Employees are the chief organizations presenting these phenomena. In all of them the proportion of women organized is much smaller than the proportion in the trade, and in all the women are but an insignificant part of the total membership of the union. In the Potters' Society they are 250 out of 6,050; in that of the Waiters 650 out of 4,800; the unions of women in the packing-houses flourished for a short time under the fostering care of a few social settlement workers, but disappeared when met by the opposition of the last few years; the women telegraphers constitute about 20 per cent of the persons in the trade and a much smaller proportion of the membership of the union. In telegraphy the workers must possess general intelligence and special skill, two characteristics favorable to the development of unionism among any set of workers. The other trades are filled by girls who learn the simple processes quickly, and do not remain long in one trade, but pass on to something new. Under such conditions it is hard to maintain a union scale against competition, and difficult to rouse interest for union principles among workers who are so transient in any one industry.

The second group of unions consists of organizations which cover trades where women work in considerable numbers and are a serious factor in the labor problem. They may compete directly with men; if so, their presence is likely to be looked upon with jealousy by their brethren, who have grudgingly organized them, because their competition outside the union was dangerous. In those trades in which women's work is supplementary to that of men their organization has usually been due to the belief of the men that the cooperation of so large a part of their fellow workers was desirable. While the number of women printers in the newspaper and periodical offices is small, their relative number in the book trade of certain places, especially in Boston, is so considerable that their competition tends to seriously affect wages. They are not organized in proportion to their numbers, being perhaps 3,000 out of 47,000 members of the Typographical Union. They learn the fundamental process of setting up straight matter in a few weeks, while men acquire proficiency in all parts of the trade during a four years' apprenticeship. Women are as accurate as the men, but not so swift, hence the policy of the union in insisting upon an identical time scale for both sexes tends to keep women typesetters out of the union offices. In places where the union scale does not prevail they receive considerably less than union wages. These facts have led to ill feeling between men and women compositors, which is not conducive to the progress of unionism among the latter.

The unusual success of the boot and shoe workers in organizing women is due to several facts: fair wages have attracted persons with sufficient intelligence to understand somewhat the significance of union principles and to carry on its work; there is little competition and resulting jealousy between men and women in the trade; a closed-shop policy, insisted upon wherever it has been possible to maintain it, has forced many indifferent women into the organization; high dues and benefits have strengthened the society and inspired the members with a sense of its power. About one third of the society's constituency is female. The Bookbinders' Union resembles in its chief features the organization of the Boot and Shoe Workers; but a larger part of the employees in the trade are women. Wages are lower, and union dues are less for women than for men. Perhaps two fifths of the employees of the tobacco factories are girls. The Tobacco Workers adhere to a policy of closed shops and identical wages for women and men, and as a result they have a smaller proportion of women than are found in the open shops where women's wages are much lower than men's. Wherever the trust is powerful a large number of girls are engaged in cigarmaking, but they do not constitute an important part of the Cigar Workers' Union, for the non-union factories make a much greater difference between men's and women's wages than that which is allowed by the union, and hence have a greater incentive to employ women.

In those industries in which women constitute the majority of wage-workers, unionism has not made encouraging progress, but its failure cannot often be attributed to this fact alone, for in a number of cases there are present other unfavorable conditions. In the manufacture of clothing the unfortunate organization of the industry, the nature of the work, which allows it to be carried on in living rooms and small shops, the competition of ever-increasing numbers of

Difficulties

foreigners, are facts as fundamental as the presence of large numbers of women. The women's locals of the United Garment Workers have been formed largely under the compulsion of the label policy, and have been maintained by the fostering care of the union's business agents. The Ladies' Garment Workers is a feeble association, which is struggling against overwhelming odds, for to the evils of the men's clothing trade there is added the misfortune of the trade's being peculiarly subject to the influence of season and fashion. But a small percentage of the employees in the great number of laundries scattered over the country are organized in the Shirt, Waist, and Laundry Workers' Union; this is partly due to the fact that, as a rule, the workers are not concentrated in large establishments, but still more to the large percentage of women in the trade. In the glove industry two thirds of the employees are women. The Glove Workers' Union, formed at the instigation of the glove-cutters' society, has effected some improvements in wages and conditions, but does not include a large part of the women glove workers. The failure of unionism among the cotton and woolen factory operatives of the U. S. is explained by a consideration of the successive waves of immigrants with ever lower standards of living which have filled the ranks of the New England industry, and of the ignorance and rural individualism

of the Southern mill hands, together with the fact that about one half the workers are women and young girls. The United Textile Workers is a struggling organization that seeks to include wage-earners of all classes.

Most of the labor organizations with which women are connected are fairly conservative in policy in spite of the declarations of socialistic principles found in their constitutions. Two of them are among the oldest and strongest unions in the country. In practically all women are admitted upon the same terms as men, have the same power of voting, and are eligible to all offices. In unions where women's wages are very low their dues and benefits are smaller than those for men. Usually one local is formed for each department of an industry, which results often in associations composed entirely of one sex, for women's work is to a good degree supplementary to that of men. In their own unions women act as officers, unless the body is very large, or the members are quite inexperienced. Several national organizations support women organizers, and in nearly all they are sent as delegates to conventions, where they serve upon the less important committees. But whatever their constitutional rights, and whatever their nominal recognition, the actual influence of women in determining the general policy of the unions has been small.

The progress of labor organization among women has thus far largely resulted from the proselyting efforts of the men in the unions, and these efforts have been exerted as women were

Policy

a more or less important factor in an industry. But the success of women's unions is everywhere dependent upon the presence of certain favorable industrial and social conditions. They are likely to be prosperous in a locality where all trades are well organized, and in a trade in which women's work is supplementary to, rather than competitive with, that of men. Women of a comparatively high standard of intelligence and of American birth make the most effective unionists. The label policy often forces indifferent women into a union, and is the means by which a few vigorous members maintain a fairly vigorous local.

Of the conditions unfavorable to development of unionism among female wage-workers certain ones are temporary and may disappear with the improvement of the organization of industry. In the sweated trades the hopelessness, low degree of vitality and of intelligence resulting from miserable wages and bad sanitary conditions, are an effectual hindrance to the organizing of women workers. The fear that the uniform scale for men's and women's work demanded by certain unions will result in the displacement of the weaker sex keeps women out of some unions. Their interests are not as carefully looked after by the unions as those of their brethren, and less effort is made to bring them into the organizations. In some industries women's presence is recent, which fact explains in part the indifference of the men and the failure of the women to realize their importance in the trade.

More serious are the following considerations, based upon fundamental facts. Women who never become identified with any trade, but pass from one industry to another doing unskilled work in each, can have no real interest in a trade-union. In many occupations the girls are too

young and untrained to consider their industrial relations as a very serious matter. Women have more home interests than men, and find there diversions which men must seek outside, and which they find in the activities of their union. The fact that a large number of women work to earn the luxuries, not the necessities, of life, renders them less ready to struggle for a living wage. Often girls refuse to join a union for fear of losing caste among their acquaintances by openly identifying themselves with the wage-workers. Of more importance than all other considerations is the fact that most women look upon work in the shop or factory as a temporary employment between school and marriage; this naturally results in an unwillingness to sacrifice any present for a future good, as is often necessary in a union, or to give time and energy to build up an organization with which they will be identified but a few years.

Wherever vigorous organizations of women have been maintained, wages have been increased and many petty annoyances have been done away with. They have been too much engrossed with the fundamental matter of wages to spend their energies in struggling directly for better sanitary conditions, but the combined labor forces of the leading manufacturing states have been largely responsible for the relatively high standards of safety and hygiene established by the factory codes. The union often serves as an educational and social institution, in which the working girl acquires a broader outlook on life; learns the lesson of subordination of self for the good of her associates; and develops that individuality which the factory life crushes out.

Harper, and others; *History of Woman's Suffrage* (4 vols., 1883-1900), Francis Parkman; *Some of the Reasons Against Woman's Suffrage*, see also leaflets of the Massachusetts Woman's Suffrage Association, 3 Park Street, Boston; *Woman's Economic Position*, August Betel; *Woman in the Past, Present, and Future* (1893), Helen Campbell; *Prisoners of Poverty and Household Economics* (1897), Grace Dodge and others; *What Women Can Earn* (1898), Charlotte P. (Stetson) Gilman; *Woman and Economics* (1899), The Home (1903), Francis A. Kellar; *Out of Work* (1904), C. Letourneau; *Condition of Women in all Races* (French), Prof. Lucy M. Salmon; *Domestic Service* (1901), *Statistics of Women at Work*, U. S. Census (1907).

WOMEN'S TRADE-UNION LEAGUES: The English Woman's Trade-Union League is a most effective organization, formed in 1874, largely through the efforts of Mrs. Paterson aided by Lady Dilke and now ably conducted by Miss Gertrude M. Tuckwell (its former secretary and now its chairman) and Miss M. R. Macarthur, its present secretary. It has affiliated with it some 100 societies and about 75,000 members. It aims at the organization of working women (usually in the same unions with men), at investigating and endeavoring to right women's trade wrongs, and at promoting remedial legislation. Address: Club Union Buildings, Clerkenwell Road, London, E. C.

In America a National Woman's Trade-Union League was formed in 1903, largely through the efforts of Mr. W. E. Walling and Mrs. Mary K. O'Sullivan. It has headquarters at present in Chicago, with Mrs. Raymond Robins as president and Miss Annie E. Nicholas as secretary. Ad-

dress: 275 Lassalle Street. The aims in the main are the same as the English League, but the society being very much younger has by no means the strength of the English League. There are active branch leagues in Chicago, with Miss Steghagen as secretary (same address as the National League); in New York, with Miss Helen Marot as secretary, 11 Waverley Place; and a less active league in Boston, with Miss Emily Greene Balch of Wellesley College as president. A Woman's Union Label League also exists. *Secretary*, Mrs. J. F. O'Neill, 565 Dickens Avenue, Chicago.

The objects and platform of the Chicago Woman's Trade-Union League, which may be taken as a sample of all, are as follows: 1. Organization of all workers into trade-unions. 2. Equal pay for equal work. 3. Eight-hour day. 4. A minimum wage scale. 5. Full citizenship for women. 6. All principles embodied in the economic program of the American Federation of Labor.

OBJECT

The object of this organization shall be to promote the interests of the trade organization of women, to forward labor legislation, to assist the local trade-unions, and to aid in the formation of new unions in all trades, especially where women are employed, such unions to be affiliated with the American Federation of Labor and with their national or international organization if such exists.

In the U. S. an important Inter-Municipal Research Committee was organized in 1904 for the study of conditions affecting the welfare of the unemployed and unskilled workers. It is composed of representatives of the following societies: Woman's Educational and Industrial Union, Boston, Mrs. Mary Morton Kehew, chairman; Woman's Municipal League, New York, Mrs. Richard Aldrich; Research and Protective Association, Philadelphia, Mrs. Wilbur F. Hamilton; College Settlements Association, Mrs. Arthur H. Scribner; Council of Jewish Women, Miss Sadie American; National League for Protection of Colored Women, William Jay Schieffelin. The committee conducts a correspondence department, "Housewives and Household Aids," in the *Ladies' Home Journal*. It has given large attention to the question of domestics, and from time to time conducts various important investigations. Miss Frances A. Kellor is the general director. *Address:* 19 East Twenty-sixth Street, New York.

In Great Britain another important organization is the Woman's Industrial Council, which publishes the *Woman's Industrial News*. *Secretary*, Miss Papworth, 7 John Street, Adelphi, London, W. C., England.

WOMAN'S WORK, CLUBS FOR: With women's clubs, so far as they are merely social, literary, artistic, scientific, or religious, this Encyclopedia is not directly concerned, but the general movement and organization of women's clubs is one of the most important and significant of social reform. Women's political and economic societies we consider elsewhere (see WOMAN'S SUFFRAGE, WOMAN'S ECONOMIC POSITION, WOMAN'S TRADE-UNIONS, etc.), but the large majority of women's clubs do not come under this head. The whole number of women's clubs in the United States is not known, nor their membership, though it is estimated at about 1,000,000.

Some 5,261 clubs with something like 800,000 members (active and associate) are organized into

a General Federation of Women's Clubs. Of the Federation, Mrs. Sarah S. Platt Decker of Denver, Colo., is president, and Mrs. Charles A. Perkins secretary. *Address:* 1547 W. Clinch Avenue, Knoxville, Tenn.

The following, from the Directory of Women's Clubs in America for 1907, is an approximation to the number of clubs in the different states including the Federation and non-Federation clubs. Most of the states have State Federations. Those starred have none:

| STATE | Clubs | Membership |
|----------------------|-------|------------|
| Alabama* | 41 | |
| Alaska* | 4 | 105 |
| Arizona | 14 | 500 |
| Arkansas | 96 | 3,925 |

WOMEN'S WAGES: If accurate statistics of men's wages do not exist except for a few trades, women's wages are still less known. Nothing that can be called statistics for very recent years exists. An investigation of woman and child labor in the United States now in progress will probably throw much light, but at present only hints can be given from various sources. A Report of the Census for Women at Work (1907) gives only their occupations and numbers. For earlier years we have more information.

According to Dr. Carroll D. Wright, women's wages in the cotton factories of New England averaged in 1831 from \$2.20 to \$2.60 per week; in 1880 the average for women ranged as high as \$6.37, and in 1890 in the entire U. S. it was \$5.53, ranging from \$3.21 to \$6.42. The average annual wages for women clerks in the U. S. for all industries was, in 1890, \$462; \$890 for men. Women operatives received \$276.

Wages

According to Mr. Wright (in the report of the Commissioner of Labor for 1889), the following was the weekly average earnings of women in industries in various cities:

| CITIES | Average weekly earnings |
|--------------------|-------------------------|
| Atlanta..... | \$4.05 |
| Baltimore..... | 4.18 |
| Boston..... | 5.64 |
| Brooklyn..... | 5.76 |
| Buffalo..... | 4.27 |
| Charleston..... | 4.22 |
| Chicago..... | 5.74 |
| Cincinnati..... | 4.59 |
| Cleveland..... | 4.63 |
| Indianapolis..... | 4.67 |
| Louisville..... | 4.51 |
| Newark..... | 5.10 |
| New Orleans..... | 4.31 |
| New York..... | 5.85 |
| Philadelphia..... | 5.34 |
| Providence..... | 5.51 |
| Richmond..... | 3.93 |
| St. Louis..... | 5.19 |
| St. Paul..... | 6.02 |
| San Francisco..... | 6.91 |
| San José..... | 6.11 |
| Savannah..... | 4.99 |
| All cities..... | 5.24 |

The report adds:

Much is heard at the present time of the very low wages paid working women. It must be clear that they do not rise, on the average, above \$5 per week, or \$5.24, as indicated by this report. The summary by cities, Table XXX, on pages 530 and 531, would seem to indicate that the majority are in receipt of fair wages, when the whole body of working women is considered; but 373 earn less than \$100 a year, and quite a large number (1,212) earn from \$100 to \$150 a year; that is, the earnings of these women, distributed by weeks over the whole year, do not amount to more than \$2 or \$3 per week. These are the great exceptions, but the figures tell a sad story, and one is forced to ask how women can live on such earnings.

Part vii. of the twentieth report of Massachusetts Labor Bureau, 1889, says:

Of the whole number of persons in industry, 73.97 per cent were single and 26.03 per cent were married. Of the males, 67.69 per cent were single and 32.31 per cent were married. Of the females, 88.29 per cent were single and 11.71 per cent were married. In 1885 as compared with 1875, the increase in married females was 39.64 per cent.

The females in industry considered were at least 10 years of age. Those from 10 to 13 years of age formed 0.13 per cent of the total; from 14 to 19 years of age, 23.19 per cent; from 20 to 29 years of age, 41.08 per cent; from 30 to 39 years of age, 15.05 per cent; 40 years of age and over, 30.55 per cent.

Of the total female population from 10 to 13 years of age, 0.55 per cent were engaged in gainful pursuits; from

14 to 19 years of age, 61.11 per cent; from 20 to 29 years of age, 59.77 per cent; from 30 to 39 years of age, 30.44 per cent; from 40 to 49 years of age, 22.58 per cent; from 50 to 59 years of age, 19.79 per cent; from 60 to 79 years of age, 21.80 per cent; 80 years of age and over, 15.84 per cent; those whose ages were unknown, 45 per cent.

Condition
More than one fifth of the women engaged in gainful pursuits in Massachusetts in 1885 were unemployed for a greater or less period during the year.

The figures given and comparisons made in relation to births, marriages, and deaths show conclusively that the presence of women in industry has not decreased the number of births or marriages, nor increased the number of deaths, for fifty cities and towns, having large percentages of women at work, with 64.39 per cent of the total population, had 69.99 per cent of the total number of births, 69.18 per cent of the whole number of marriages, and but 63.53 per cent of the total number of deaths.

Of the whole number of women reporting, 6 were paid less than \$25 per month; 88, \$25 and under \$50; 144, \$50 and under \$75; 88, \$75 and under \$100; 73, \$100 and under \$200; 2, \$200 and under \$300, and 2 a salary in excess of \$300 per month. Forty-eight failed to answer the questions concerning compensation.

According to "What Women Can Earn" (1898), written by Miss Grace Dodge and others, the following are the ordinary city wages for girls and women:

In the manufacture of boots and shoes, \$4.50 to \$12; cotton goods (spinners), \$3 to \$6; (weavers), \$3.75 to \$8; for typesetters, \$6 to \$12; the silk industry, \$4.50 to \$7.50; woolen manufacturing, \$3 to \$9.

In the great stores, salesgirls, \$4 to \$5; cash girls, \$2 to \$3; saleswomen, \$8 to \$10. See also statistics on page 1,290.

Women's wages in Europe are much lower. (For Great Britain, see WOMAN'S ECONOMIC POSITION IN GREAT BRITAIN). In France, according to M. Le Comte d'Haussonville, in the preface to M. Gibon's "Employés et Ouvrières," girls' and women's wages are rarely over three to four francs per day (sixty to eighty cents). In some establishments they are said to be as low as thirty cents per day. In Germany women in factories, stores, and in domestic service are carefully protected and their wages are rising, yet often still very low. In the sweated home industries in Berlin and elsewhere, they receive often as low as two or three cents per hour.

WOODRUFF, CLINTON ROGERS: Secretary of the National Municipal League; born 1868, Philadelphia, Pa.; graduate of the University of Pennsylvania, college and law departments. From 1897 to 1900 member of the Pennsylvania Legislature; in 1903 was special investigator, with the Hon. Charles J. Bonaparte, in the Indian Territory; in 1906 appointed by Governor Pennypacker registration commissioner. Since 1894 Mr. Woodruff has been actively identified with the movement for the improvement of municipal conditions in the United States; served as secretary of the Philadelphia Municipal League and later as its counsel; has also served as secretary of the National Municipal League since its formation in 1894; has been actively and officially associated with the American Civic Association, Electoral Reforms Committee, and various other bodies engaged in the work of improving municipal conditions. Author of the "Personal Registration," amendment to the Constitution of Pennsylvania. A frequent contributor to the current periodicals, and editor of the "Proceedings of the National Municipal League." Address: 703 North American Building, Philadelphia, Pa.

WOODS, ROBERT ARCHEY: Head of South End House, Boston; born, Pittsburg, Pa., 1865; graduated at Amherst College, 1886. Studied at Andover Seminary, 1886-90. Resident of Toynbee Hall, London, 1890. One of the founders in 1891 of the social settlement called Andover House, now the South End House, of which he was appointed head worker, a position he has since continuously occupied. Lecturer on sociology at Andover Seminary, 1890-96; since then lecturer at Episcopal Theological School, Cambridge. Mr. Woods has taken part in many movements for the betterment of human conditions, municipal, social, economic, industrial. One of his most important services has been the editing of "The City Wilderness" and "Americans in Process," two volumes of social studies made by himself and fellow-workers at the South End House. He welcomes all well-considered experiments toward democratizing industry and culture. Author: "English Social Movements." Address: 20 Union Park, Boston.

WOOLLEY, JOHN GRANVILLE: Temperance reformer; born Collinsville, Ohio, 1850; gradu-

ated from Wesleyan University, Ohio, 1871; A.M., 1873; attended Law School University of Michigan, 1872; admitted to the bar in Supreme Court of Illinois, 1874; admitted to practise in United States Supreme Court, 1885; practised in New York City, 1886; in 1888 entered lecture field, and has since spoken on the subject of prohibition of the liquor traffic in the principal English-speaking cities of the world. In 1899 became editor of *The New Voice*; in 1900 was nominee of Prohibition Party for President of the U. S. Mr. Woolley considers the traffic in alcoholic drinks the greatest question in practical politics, financially, industrially, morally, and believes it to be a question not only for the police power of the states, but also for the police power of the federal government in the District of Columbia, the territories, and the islands; and in the use of the taxing power in the Department of Internal Revenue. Author: "Seed"; "The Sower"; "Civilization by Faith"; "The Christian Citizen"; "A Lion Hunter." Address: 5535 Cornell Avenue, Chicago.

WOOLMAN, JOHN: Philanthropist, abolitionist; born Northampton, West Jersey, 1720. His youth was spent on a farm, and he lived by the labor of his hands, chiefly as a tailor. Began his public ministry at Mount Holly, N. J., about 1742 by teaching poor and neglected children. As a Friend (or Quaker) he spent much of his time traveling and preaching. In a tract, "On the Keeping of Negroes" (two parts, 1753-1862), he pointed out the dangers of slavery. In 1772 he visited England, and died at York, in that year, of smallpox. Channing considered his "Journal" the purest and sweetest of autobiographies. The "Journal" has been published with an introduction by the poet Whittier.

WOOLSEY, THEODORE DWIGHT: Former president of Yale College; born New York, 1801; graduated at Yale College in 1820. Read law in Philadelphia; studied theology at Princeton; was tutor at Yale, 1823-25; studied languages abroad, 1827-30; was elected professor of Greek at Yale in 1832 and president in 1846; resigned in 1871. Author: "An Introduction to the Study of International Law" (1860); "An Essay on Divorce and Divorce Legislation" (1869); "Political Science" (1877); "Communism and Socialism" (1879). Died in 1889.

WORKING WOMEN'S CLUBS: A working woman's club or society is an organization formed among busy young women and girls to secure, by cooperation, education, opportunities of social intercourse, and the development of higher and nobler aims in life. They are non-sectarian and self-governing, and they endeavor as far as possible to meet their own expenses by means of fees, entertainments given by the members, sale of articles made in classes, or by good business management in the subletting of club rooms.

In most cases girls are admitted who have passed the age of fourteen. Some require the indorsement of a club member for admission, others welcome freely all newcomers, believing that the general intelligence and serious purpose of the other members will exclude the unworthy.

The fees in clubs vary from ten cents to twenty-five cents a month, while in some clubs yearly fees of \$1 or \$1.50 are preferred.

EDITH M. HOWES.

WORKMEN'S SECRETARIATES: Legal aid bureaux in Germany, organized and managed by working men.

The Social Democrats early saw the vast advantage which the new laws, particularly those on imperial insurance, gave their comrades, and the more intelligent among them studied these laws not only with a view for their own benefit, but for that of their fellow workers. These men gave their free evenings to the instruction of their comrades in points of law, to advise them in particular cases, etc. The work soon grew to such dimensions in the larger cities, that permanent secretaries had to be appointed to attend to the manifold duties of the office, and to devote their whole time to it.

The usefulness of these bureaux may be inferred from the fact that thirty-two of them reported 195,679 visitors and advice given on 197,927 subjects on different aspects of law in a single year. One bureau of Cologne advised 14,824 people in 1904. A further proof of the importance of this institution is the fact that a Central Workmen's Secretariate was established in Berlin, April 1, 1903, as a sort of clearing-house for the numerous local bureaux. They have rapidly grown in number, as they have extended their sphere of usefulness. The Roman Catholics had sixty-two in 1905; the Protestants have fewer. The most numerous, running into several hundreds, are those of the Social Democrats. The first one was established in Nuremberg, 1891; it worked so well that the Social Democrats saw in it a powerful weapon for benefiting their comrades, and for making propaganda for their partisan politics, that they have created new ones in every industrial center, altho advice is usually given free to all comers, whether trade-unionists of the Social Democratic type, of other associations, or not union men at all.

WORLD'S YOUNG WOMEN'S CHRISTIAN ASSOCIATION, THE: To Great Britain is due the credit of having the first organization which bore the name Young Women's Christian Association.

This was founded in 1884. And out of that root has grown the mighty tree whose branches now throw their protecting shade over Europe, America, Africa, Asia, and even far-off Australasia.

It is a comprehensive work, yet one neither unpractical nor impossible, as the present number of 7,000 branches in nearly every country of the civilized world will show. Each country has the responsibility of arranging its own details, and modifying or adjusting details to the local conditions, but the fourfold aim and symmetrical development is everywhere kept in view. Such a work can justly claim the interest and cooperation of women of all ranks and conditions.

The central point around which all work centers is an Institute or a Home. Here the fourfold work—physical, intellectual, social, and spiritual—is done.

Executive Committee.—Mrs. G. W. Campbell (president), Mrs. J. H. Tritton, the Hon. E. Kinaird (vice-presidents), Miss Morley (treasurer), Miss Clarissa H. Spencer (general secretary), Miss Ethel Stevenson (corresponding secretary). Office: 26, George Street, Hanover Square, London, W.

WRIGHT, CARROLL DAVIDSON: Former United States Commissioner of Labor; president

of Clark College, Worcester, Mass.; born 1840; educated in common schools and academy of Washington, N. H., high school at Reading, Mass., academies at Alstead, N. H., and Chester, Vt.; taught school in Langdon, N. H., and other places. Aug., 1862, enlisted as private in Fourteenth Regiment, New Hampshire Volunteers; was promoted in 1863 to the adjutancy, and in 1864 to the colonelcy of the regiment; on account of ill health resigned in March, 1865. Studied law, was admitted to the bar in Keene, N. H.; began practise in Boston, Mass., 1867; elected to state Senate of Massachusetts for the terms of 1872-73. In June, 1873, he was appointed chief of the Bureau of Statistics of Labor of Massachusetts; in Jan., 1885, U. S. Commissioner of Labor, holding that position until 1905. By special act of Congress in 1893 was designated by the president to close up the eleventh census, and served in that capacity until 1897. Served as member and recorder of the Anthracite Coal Strike Commission appointed by President Roosevelt in 1902; 1902 elected president of Clark College, Worcester, Mass.; university lecturer at Harvard, Johns Hopkins, Northwestern, Illinois, and has lectured at Dartmouth. For ten years was on the faculty of the Catholic University of America, and served for several years on the faculty of the George Washington University at Washington. Mr. Wright believes that political economy should be enriched by dealing with ethical questions; and that all social reform grows out of new conditions, and must be treated from an evolutionary standpoint, ethics prevailing in the treatment. Author of, among other writings: "Industrial Evolution of the U. S." (1887); "Outline of Practical Sociology" (1899); "Ethical Phases of the Labor Question"; "The Battles of Labor" (1896); and many pamphlets on social and economic topics; has also prepared some sixty volumes of official statistics. Address: Clark College, Worcester, Mass.

WYCKOFF, WALTER AUGUSTUS: Professor of political economy; born Mainpuri, India, 1865; was graduated from Princeton University, 1888; post-graduate work Princeton, 1888-89; the following year studied and traveled abroad; in 1891, that he might study at close range the sociological and economic conditions of wage-earners in America, he became a wage-earner himself, and during a period of eighteen months lived by day's labor and worked his way from Connecticut to California; spent 1893-94 as private tutor, and traveled twice around the world. Appointed social science fellow, Princeton, 1894; lecturer on sociology, 1895; assistant professor of political economy, 1898; member of American Economic Association and American Academy of Political and Social Science. In economics Mr. Wyckoff is a conservative; in social reform, a liberal. Author of "The Workers—the East"; "The Workers—the West"; "A Day with a Tramp, and Other Days." Address: Princeton, N. J.

WYCLIF, JOHN: Wyclif, the great English reformer, never lost himself in purely political affairs. It was only in matters of a mixed ecclesiastical and political kind that he concerned himself. His one absorbing aim was to reform the Church and purify it by leading back to a condition of apostolic poverty. Yet while his

conclusions were immediately concerned with the ecclesiastical situation, they have a sociological bearing and show even a socialistic tendency.

In his strictures against Church endowments and papal disabilities imposed on those who withheld their goods from the Church, his main point is that no man can grant anything to another and to his descendants in perpetuity, since possession and the right to possess depend upon a man's being in a state of grace. The argument seems to be an accommodated one, growing out of his championship of the nation's independence of the Roman hierarchy, for he arrives straightway at the conclusion that if the Church fail in its duty the temporal lords may deprive it of its temporal possessions, the judgment of such failure lying not with the theologian but with the civil politician. Nevertheless this position is the groundwork of his Latin treatises entitled "De Dominio Divino," "On the Lordship of God," and "De Civili Dominio," "On Civil Lordship."

In these two works his thesis is that lordship depends upon service. Here we find the principle of the dependence of the individual soul upon God alone, which distinguishes Wyclif's from any other system of the Middle Ages and which strikes at the heart of privilege. He maintains that no one in mortal sin has any right to any gift of God. He adopts the doctrine of Augustine, who had said, "Sin is nothing and men when they sin become nothing," and he argues that as sinners are really nothing, they of course can possess nothing. Such possession as the wicked have is not possession at all, but they only occupy for a time that which they have unrighteously usurped or stolen from the righteous, who are lord of all things. Even when the righteous are afflicted in this life, they still have true possession of the whole universe, inasmuch as "all things work together for good" to them.

Wyclif transfers this conception from the religious to the political sphere. The rank which a man has in the eyes of God must involve his rank in the eyes of men. He pursues his doctrine to the logical conclusion that as there are many righteous, and each is lord of the universe, all goods must necessarily be held in common. He avows this doctrine of community without doubt or hesitation. And yet from several guarded sentences it would appear that he does not favor a communistic reorganization of society for the present, but only looks forward to it as a future ideal.

The possibility of mischief under such teachings is very apparent. It is not for man to judge against man, since the personal equation is never to be depended on. The rich man will accept his prosperity as evidence that he is righteous, as with the ancient Jews. The poor man very easily arrives at the conclusion that he is the only righteous man and that the possessing classes are unrighteous and therefore may be deprived of their lordship. Wyclif recognized this danger and warns against the resort to force except it be likely to put an end to tyranny. And yet while it seems certain that Wyclif had no connection with the Peasants' War, and that he sincerely deprecated it, it is more than probable that John Ball and Wat Tyler found justification for the outbreak they headed in the teachings of the great divine.

Y

YOUNG MEN'S CHRISTIAN ASSOCIATION: Formed (London) 1844, under the leadership in England of Sir George Williams, and in North America of the North American International Committee (1854); on a specific Christian basis, its object is the physical, mental, social, and spiritual benefit (a) of its members, (b) of young men in general, (c) of boys, the young men of to-morrow. Associations in the world, 8,332, of which 1,868 are in North America. The total membership of these North American associations is 405,789; they occupy 552 buildings of their own, valued at \$30,857,430. They have 36,293 young men as students in evening educational classes, 153,473 in their physical departments, and nearly 74,478 in Bible classes. They employ 2,339 general secretaries and other paid officials, and expended last year for current expenses—local, state, and international—\$5,314,028. North America contains approximately one quarter of the total number of associations in the world, one half of the total membership, three quarters of the total number of employed officers, and three quarters of the total value of buildings and equipment. This statement of the relative standing of the American movement is essential to the recognition of its real position of leadership, a leadership also signally manifested in the extension of its work to non-Christian lands in other continents. *International Com-*

mittee, office No. 3 West Twenty-ninth Street, New York. *General Secretary*, Richard C. Morse. This committee is the general executive of the associations of North America. It consists of fifty-four representative Christian laymen and employs a force of fifty secretaries in the home and fifty in the foreign field. In conjunction with thirty-six state and provincial committees it has promoted every phase of work just described, and has been a leading factor in extending the movement among railroad and other industrial men, students, soldiers, sailors, and negroes. *World's Committee*, office No. 3 rue General Durant, Geneva, Switzerland. *General Secretaries*, C. Fremoud and C. Philidius.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION (see also *WORLD'S Y. W. C. A.*): In the United States, the organization was formed 1858 as the "Ladies' Christian Union." By 1871 there were thirty Y. W. C. A.'s in the U. S., and an International Board was developed. In 1886 another national organization was started under the same name with the special object of establishing Y. W. C. A.'s in schools and colleges. In 1906 the two organizations came together. *National President*, Miss Grace H. Dodge; *Secretary*, Mrs. Wm. Rossiter, 125 East Twenty-second Street, New York.

Z

ZACHER, GEORGE: Director of Imperial Statistical Department; born 1854, Königsberg, East Prussia. Traveled for the purpose of social study in Europe and America in the years 1887, 1906-7, and 1904, and in the years 1895, 1903 and 1905 made special journeys to Africa for the purpose. Has written many articles on conciliation and arbitration, strikes and lockouts, out-of-work insurance, etc. Dr. Zacher believes that social reform, if it is to be successful, must be based upon the combination of self-help and State aid; private initiative and State interference. Author: "Working Men's Movement and Social Reform in Germany"; "Guide for Women's Insurance in Germany"; "Die Arbeiter Versicherung im Auslande"; "Handwörterbuch der Staatswissenschaften." Address: W. I. Potsdamer Strasse 134a, Berlin, Germany.

ZOAR: The communistic settlement of Zoar was founded in 1817 by a sect from Württemberg, in Germany, called Separatists. The communistic element, however, was an afterthought, only dating from 1819. Objection to war and to the formalities of the established religion, coupled with a warm welcome from the Quakers of Philadelphia, seem to have drawn them from Germany. Joseph Baumeler was their main leader till his death in 1853. They allowed marriage, maintained family life, and seemed broader in their religious views than most of the German communistic sects of America. According to Professor Ely's "The Labor Movement in America" (1886), they then owned several thousand acres of land, had several manu-

facturing establishments, and property valued at \$1,500,000, with a membership of 390 souls. They gradually grew however, smaller in number, and more like a rich corporation than a community, till they finally dissolved as a community in 1898.

ZUEBLIN, CHARLES: Professor of sociology, University of Chicago; born Pendleton, Ind., 1866; educated in the public schools of Philadelphia, University of Pennsylvania, Northwestern University (Ph.B., 1887), Yale University (D.B., 1889), and the University of Leipzig. Established, 1891, the Northwestern University Settlement in Chicago, and in the same year organized the Chicago Society for University Extension. In 1892 was appointed instructor in sociology in the University of Chicago. For several years thereafter specialized on English social questions, spending successive vacations in Great Britain. A member of the London Fabian Society, with whose views he is in general sympathy. Early made the acquaintance of ethical culture lecturers and societies in England, Germany, Switzerland, and America, and has lectured for many of the American societies; has also lectured in university extension from the Atlantic to the Pacific coast. During the last ten years has specialized in municipal sociology with special reference to American cities. Mr. Zueblin has written many articles and reviews for the sociological and economic journals. Author: "American Municipal Progress," "A Decade of Civic Development," "The University of Chicago, Chicago, Ill."
